
THE SPECTRA OF SOME ARITHMETICAL MATRICES

Alexander Pushnitski

King's College London

March 4, 2024

A GCD matrix is a (finite or semi-infinite) matrix whose (n,m) 'th matrix entry involves the greatest common divisor of n and m . I will discuss what is known about the spectral analysis of such matrices. This question has a classical nature but it came to the attention of analysts in recent years in connection with some questions of analytic number theory.
