Search for Quantum-Gravity-Motivated Effects in IceCube

outline

Teppei Katori for the IceCube collaboration
King's College London

COST CA18108 Fourth Annual Conference, University of Rijeka, Croatia
July 11, 2023

KING'S College LONDON

1. Introduction

2. IceCube experiment

3. Astrophysical neutrino diffuse samples

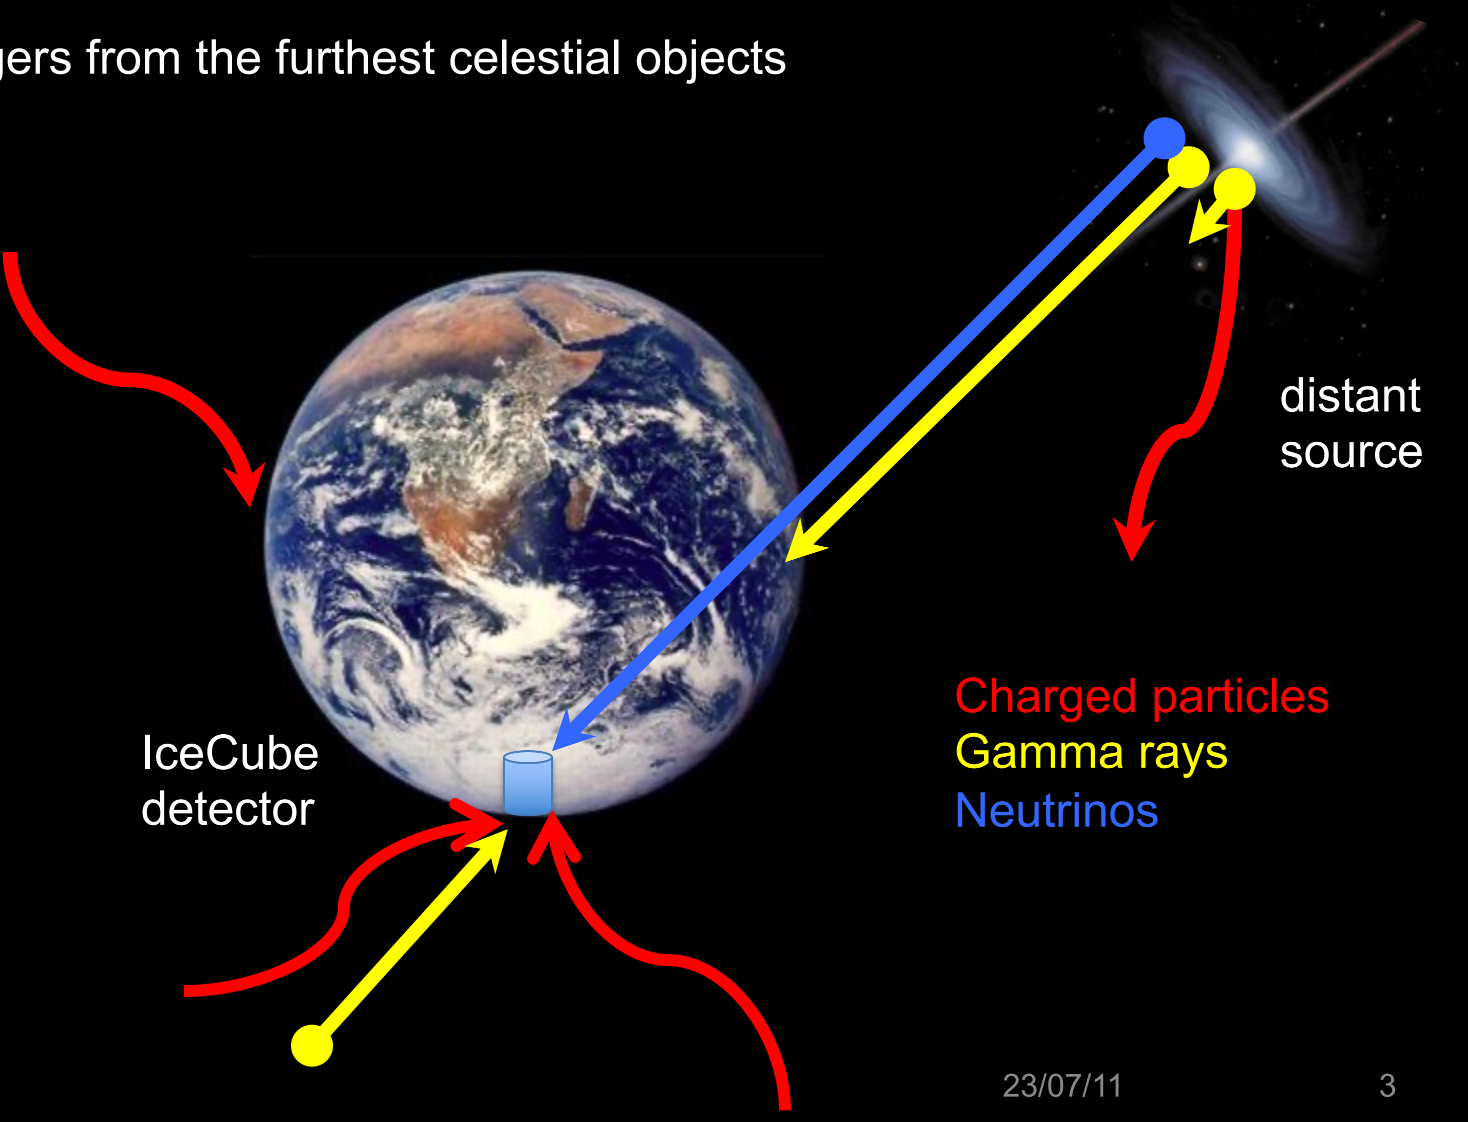
4. Astrophysical neutrino sources

5. Search for Quantum-Gravity-Motivated Effects

6. Conclusions

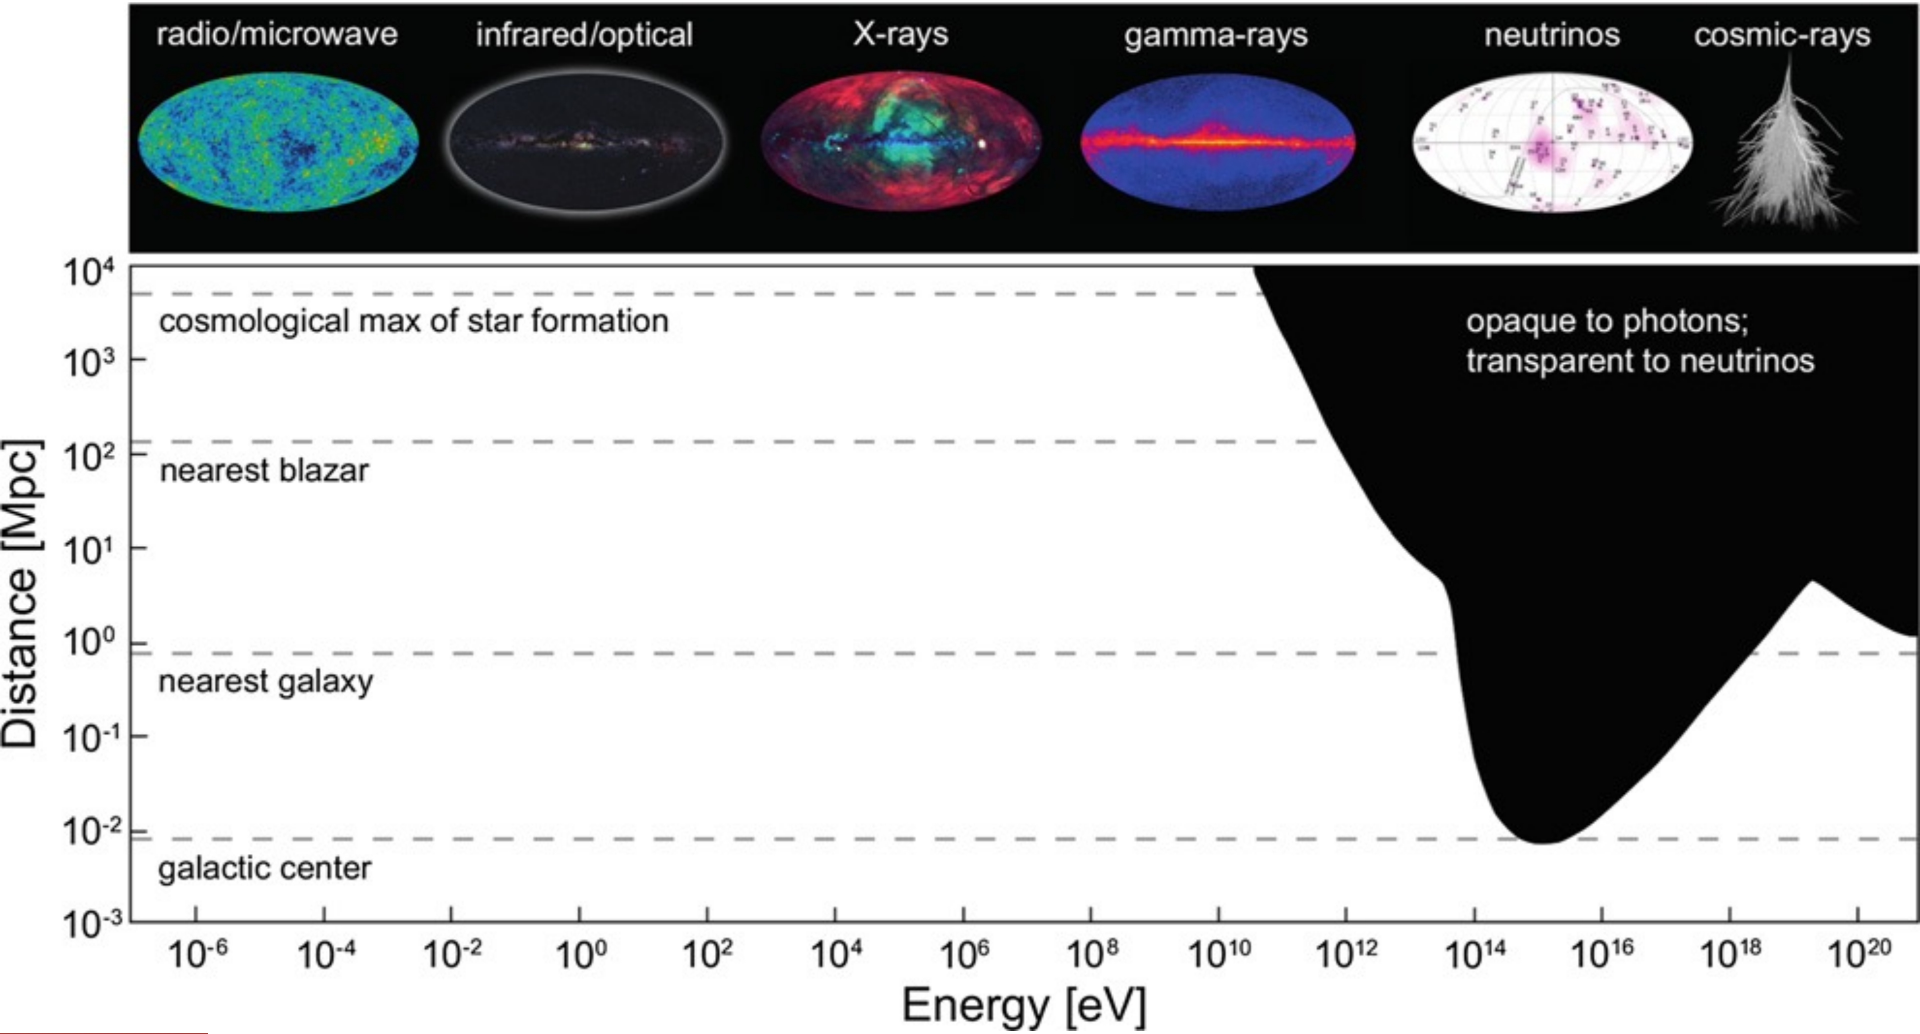
1. High-energy astrophysical neutrinos

Direct messengers from the furthest celestial objects



1. High-energy astrophysical neutrinos

Above ~10-100 TeV neutrinos are only direct extra-galactic messengers

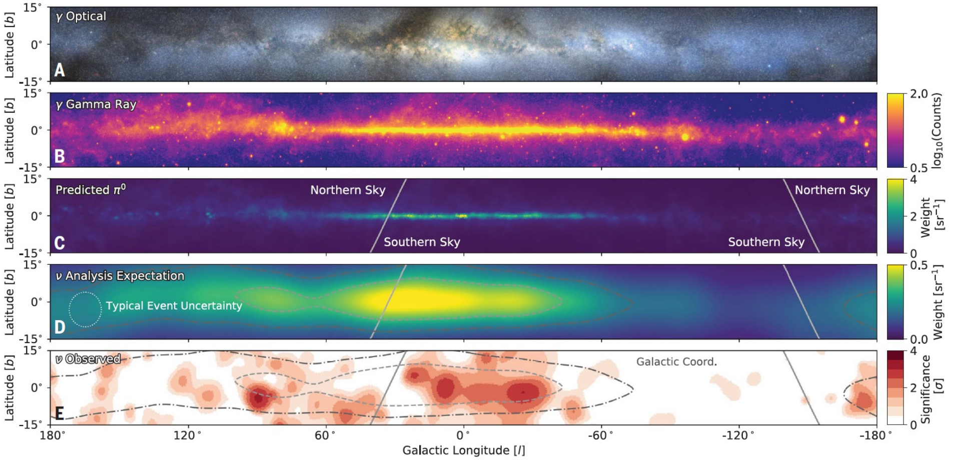


IceCube, Science 380(2023)1338
IceCube et al, Science 361(2018)146

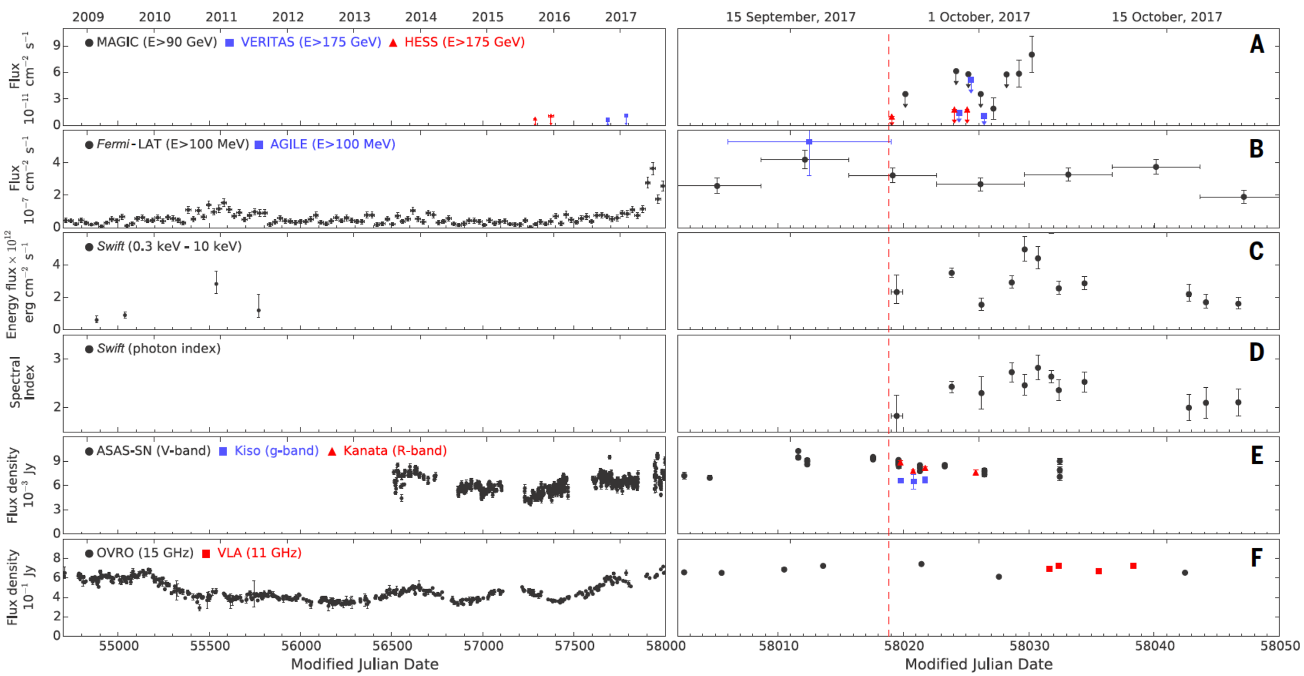
1. Multi-messenger astronomy

Astrophysical point sources may emit photons, neutrinos (and gravitational waves)

Galactic plane in photons and neutrinos



TXS0506+056 blazar photons and neutrinos



1. Multi-messenger astronomy

High-energy protons, gamma rays, and neutrinos are all related

$$\begin{matrix} p+p \\ p+\gamma \end{matrix} \rightarrow X + \pi \begin{cases} \pi^0 \rightarrow \gamma\gamma \\ \pi^+ \rightarrow \mu^+ + \nu_\mu \\ \mu^+ \rightarrow e^+ + \bar{\nu}_\mu + \nu_e \\ n \rightarrow p + e^- + \bar{\nu}_e \end{cases}$$

2. IceCube event morphology

Track
ν_μCC

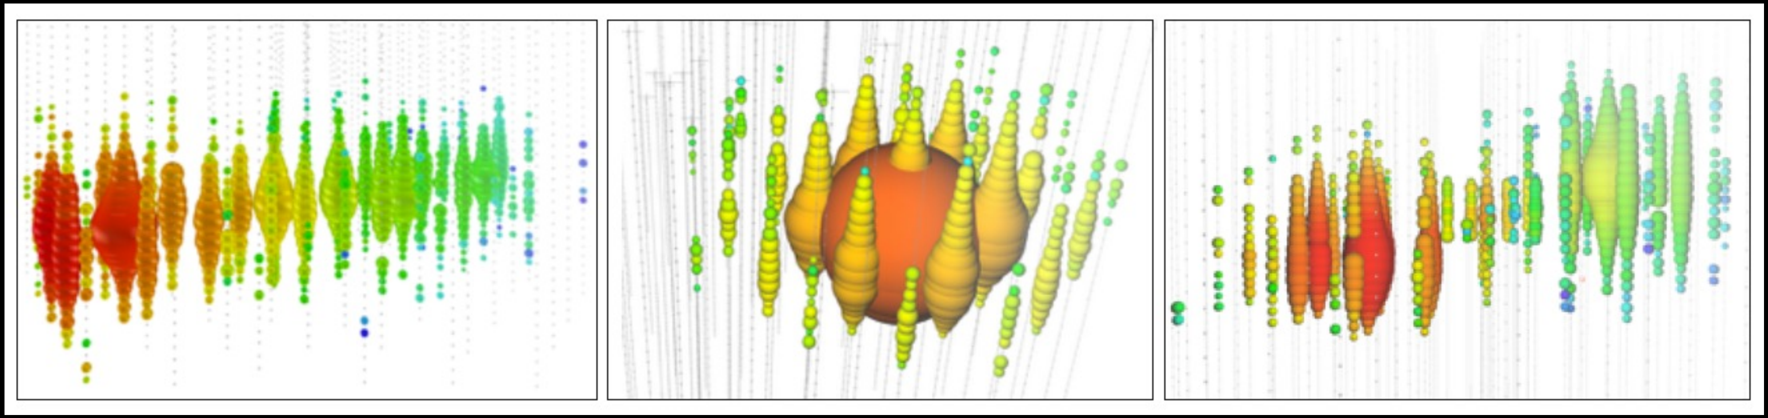
$$\nu_\mu + N \rightarrow \mu + X$$

Cascade
ν_eCC, ν_τCC, NC

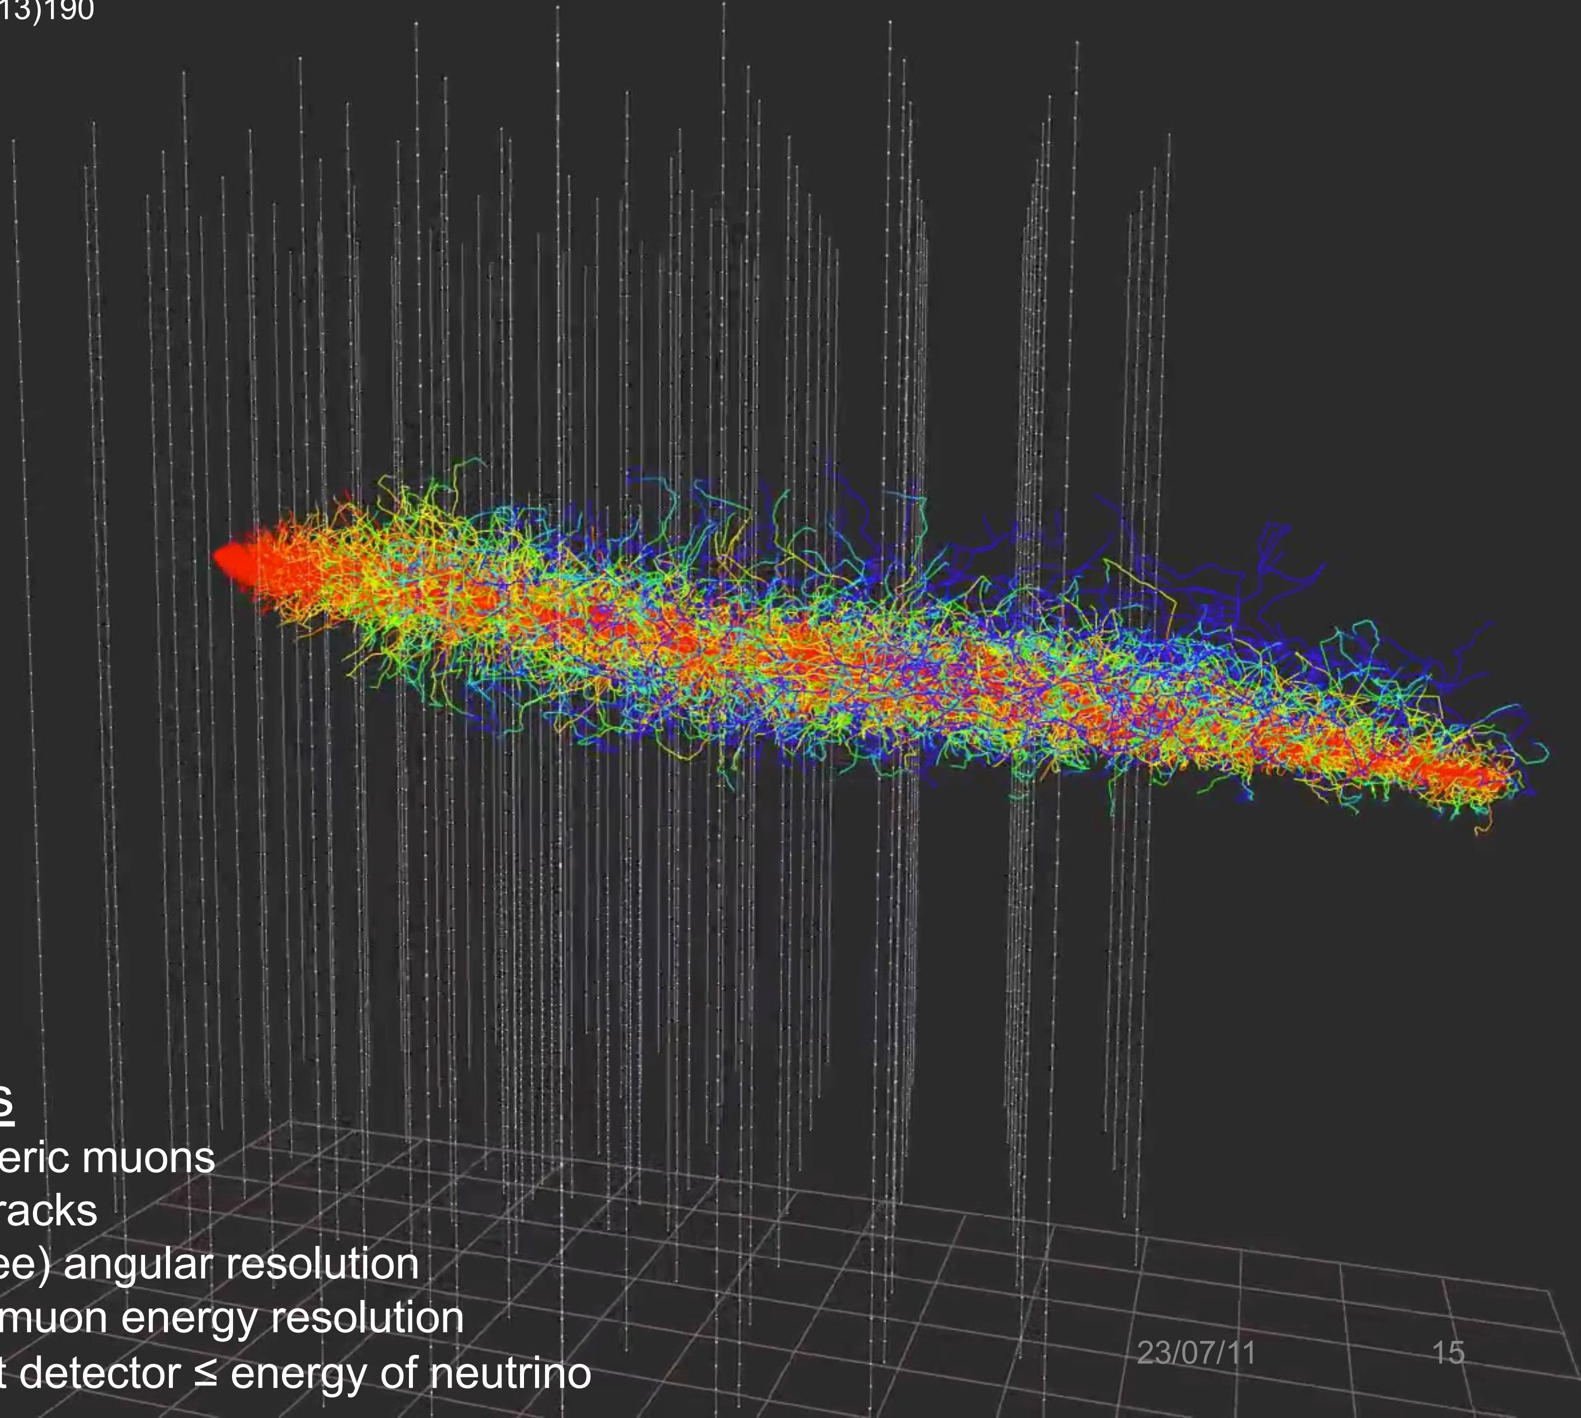
$$\nu_e + N \rightarrow e + X$$
$$\nu_\tau + N \rightarrow \tau + X$$
$$\nu_x + N \rightarrow \nu_x + X$$

Double cascade
ν_τCC (L~50m•E/PeV)

$$\nu_\tau + N \rightarrow \tau + X$$
$$\tau \rightarrow X'$$



IceCube, NIMA703(2013)190



Track events

ν_μCC, atmospheric muons

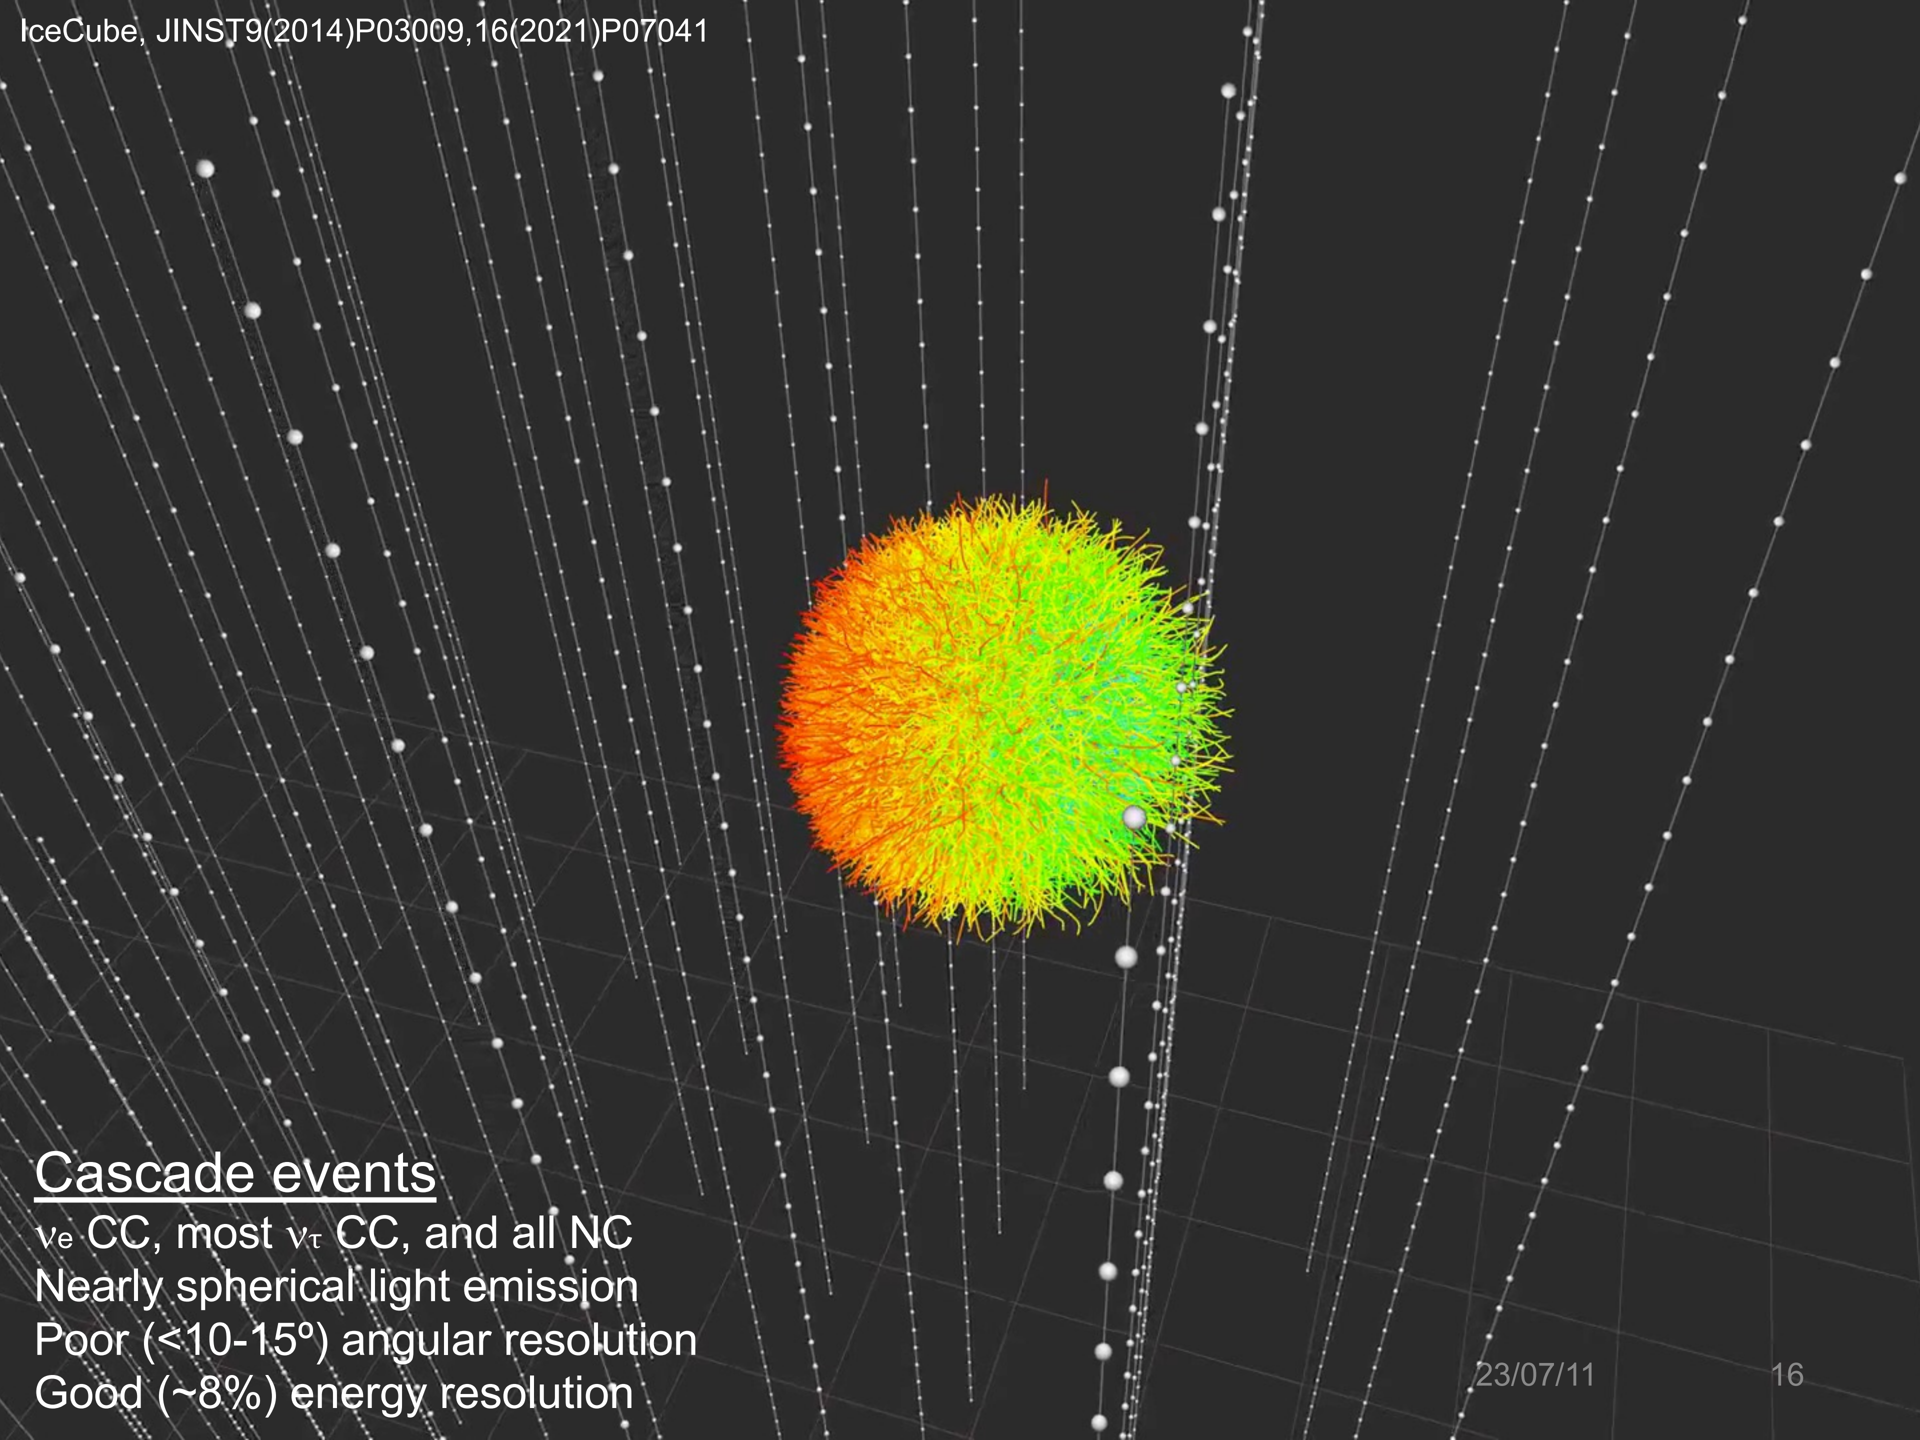
Long, straight tracks

Good (<1 degree) angular resolution

Poor (11-22%) muon energy resolution

Muon energy at detector ≤ energy of neutrino

IceCube, JINST9(2014)P03009,16(2021)P07041



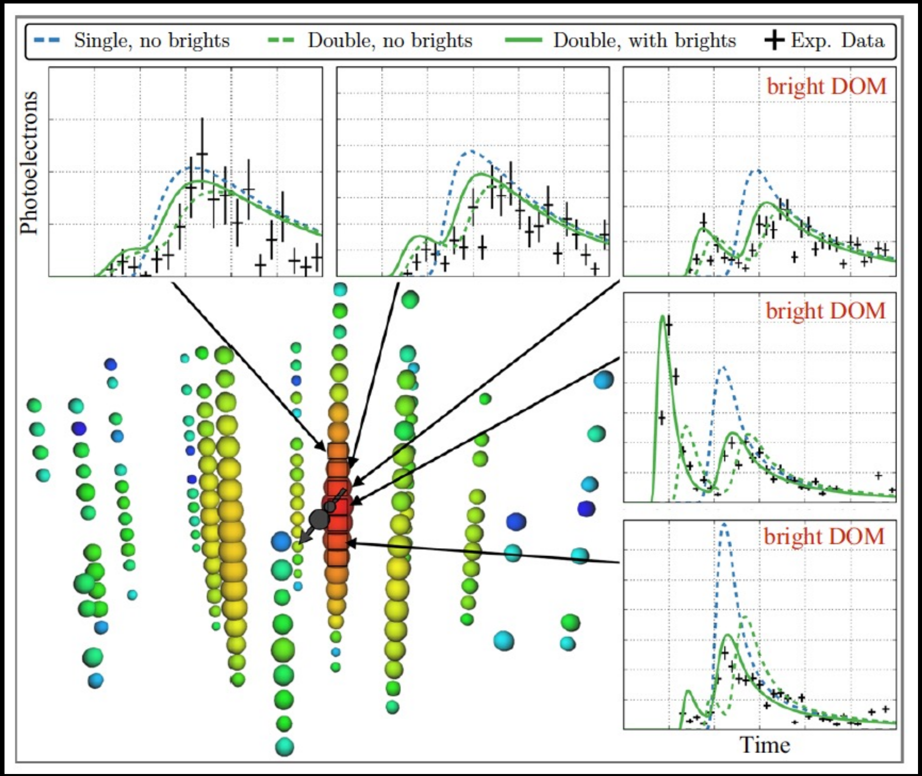
Cascade events

ν_e CC, most ν_τ CC, and all NC
Nearly spherical light emission
Poor (<10-15º) angular resolution
Good (~8%) energy resolution

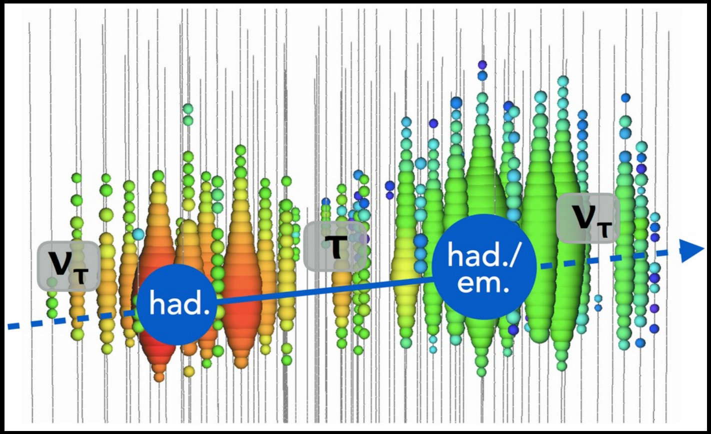
2. Double cascade events

Double bang → double pulse

- Tau propagation, ~50m(E/PeV)
- Astrophysical tau neutrino candidates (x7)



Astrophysical tau neutrino candidate
"Double Double"



Double pulse can be found using timing information.

Improved tau PID algorithm is used for the flavour analysis

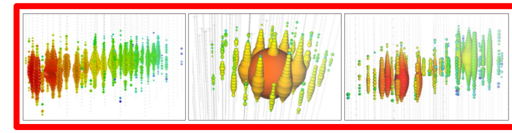
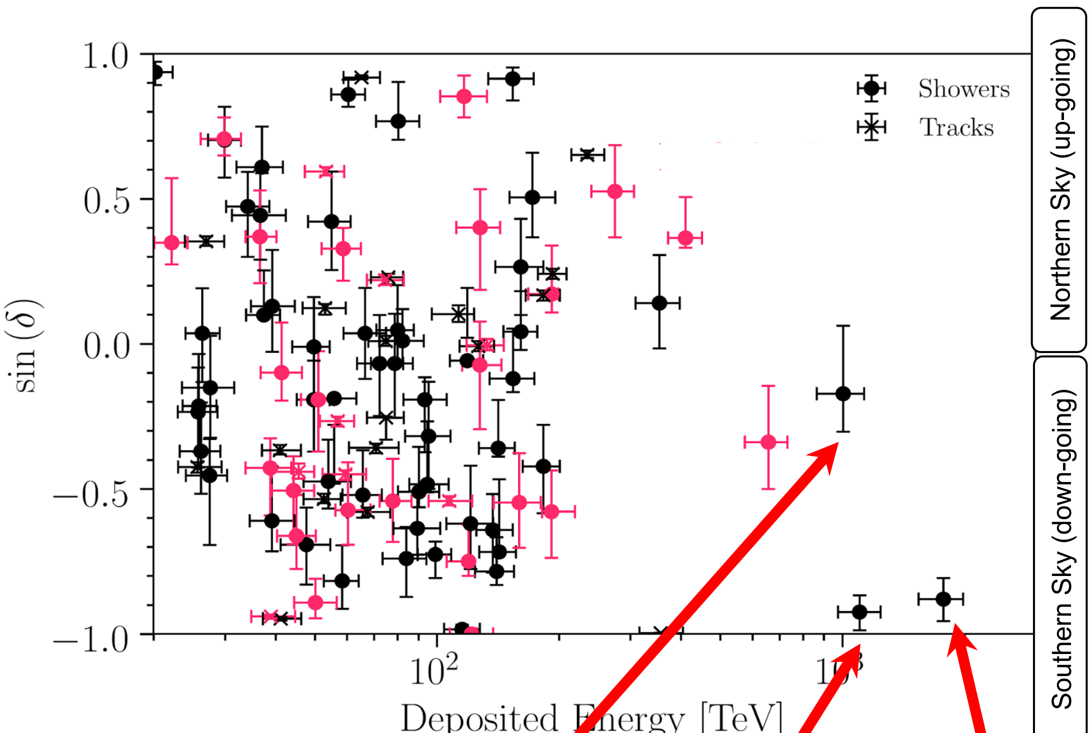
6. Conclusions

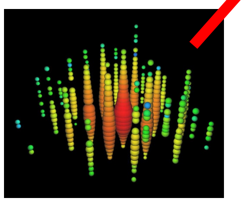
IceCube,Science.342(2013)1242856,PRD104,(2021)022002



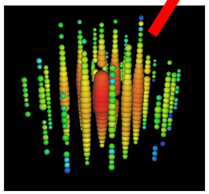
3. High-energy starting event (HESE) sample

60 events in 60-2000 TeV (7.5-yr data)
- Mostly down-going events (Southern sky)

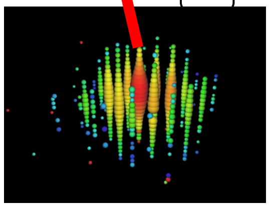




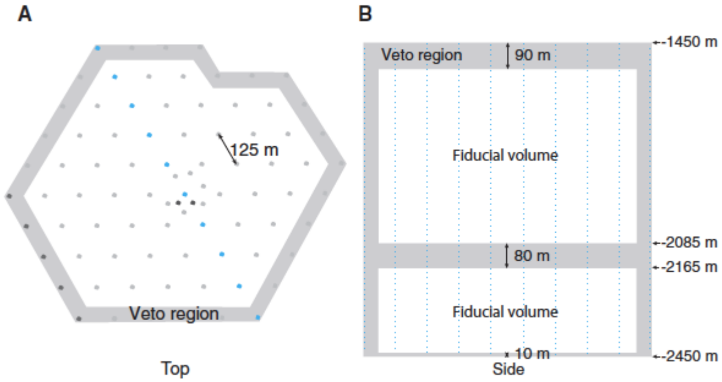
"Bert"
1.1 PeV

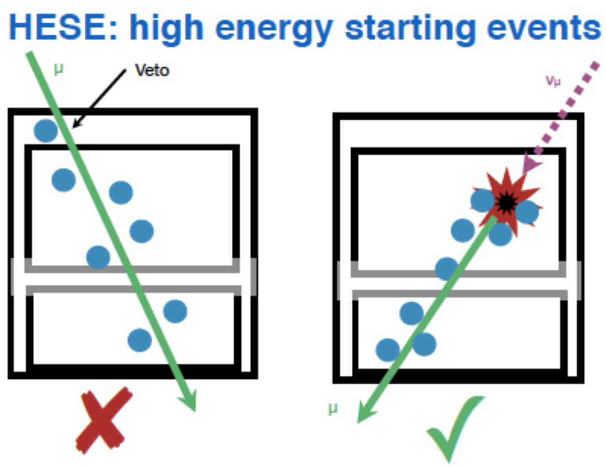


"Ernie"
1.0 PeV



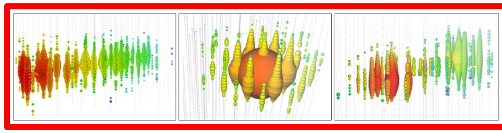
"Big Bird"
2.0 PeV





IceCube,Science.342(2013)1242856,PRD104,(2021)022002

3. High-energy starting event (HESE) sample

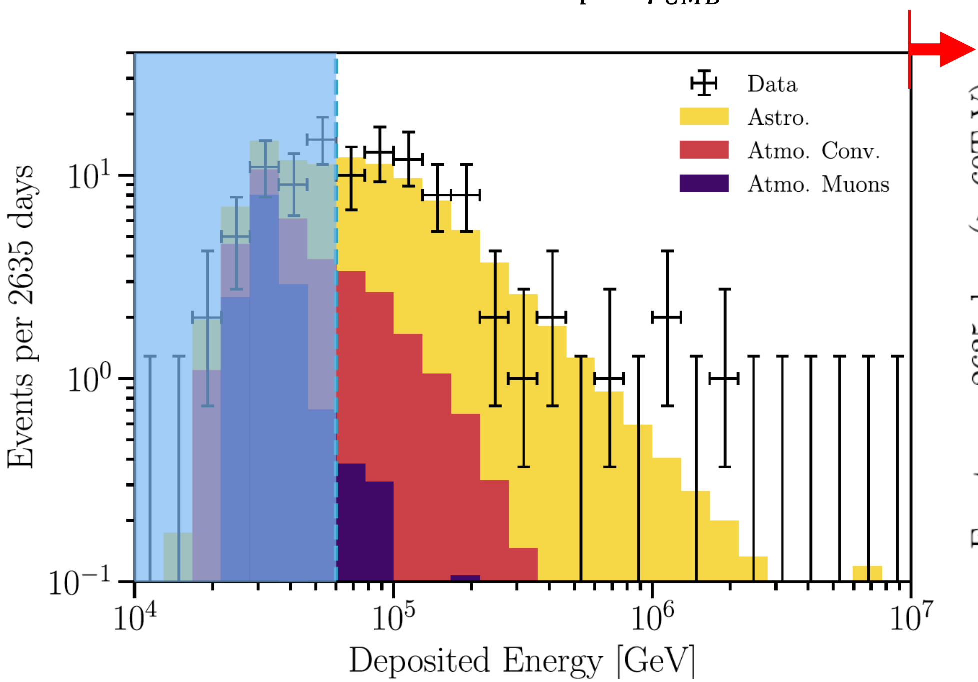


60 events in 60-2000 TeV (7.5-yr data)

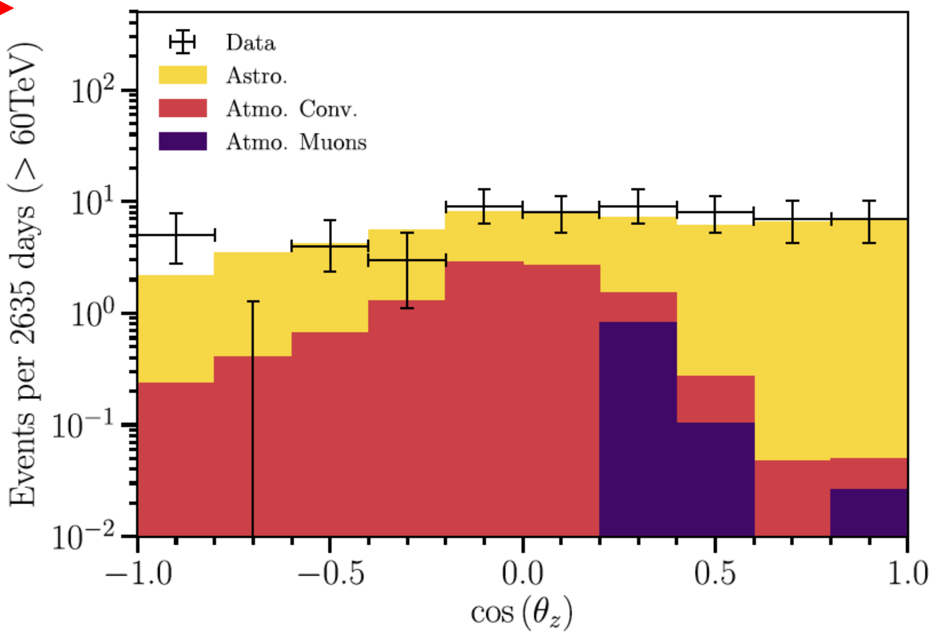
- Mostly down-going events (Southern sky)
- Not atmospheric and cosmogenic neutrinos

Cosmogenic “UHE” neutrinos

$p+\gamma_{CMB}\to\Delta\to\pi\to\nu$



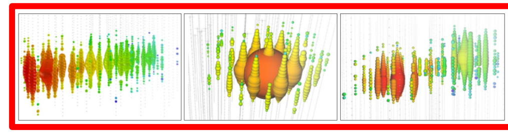
HESE energy spectrum



HESE angular distribution

KING'S College LONDON

3. High-energy starting event (HESE) sample



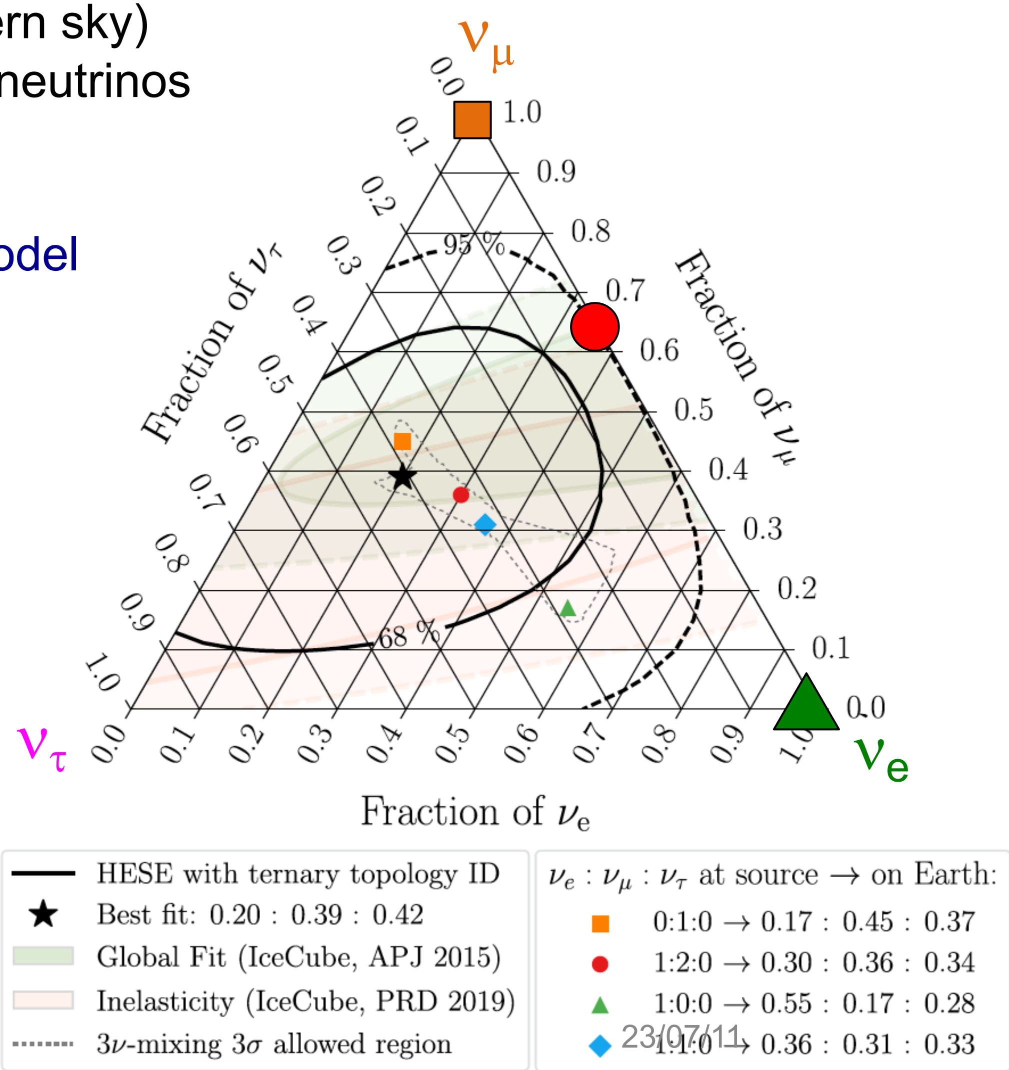
60 events in 60-2000 TeV (7.5-yr data)

- Mostly down-going events (Southern sky)
- Not atmospheric and cosmogenic neutrinos
- Flavour structure not understood

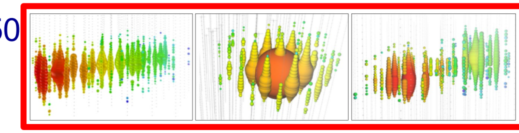
Astrophysical neutrino production model

- $\nu_e:\nu_\mu:\nu_\tau$ ~ 1:2:0
- After mixing, $\nu_e:\nu_\mu:\nu_\tau$ ~ 1:1:1

Flavour ratio is obtained from the likelihood function including double cascade hypothesis



KING'S College LONDON

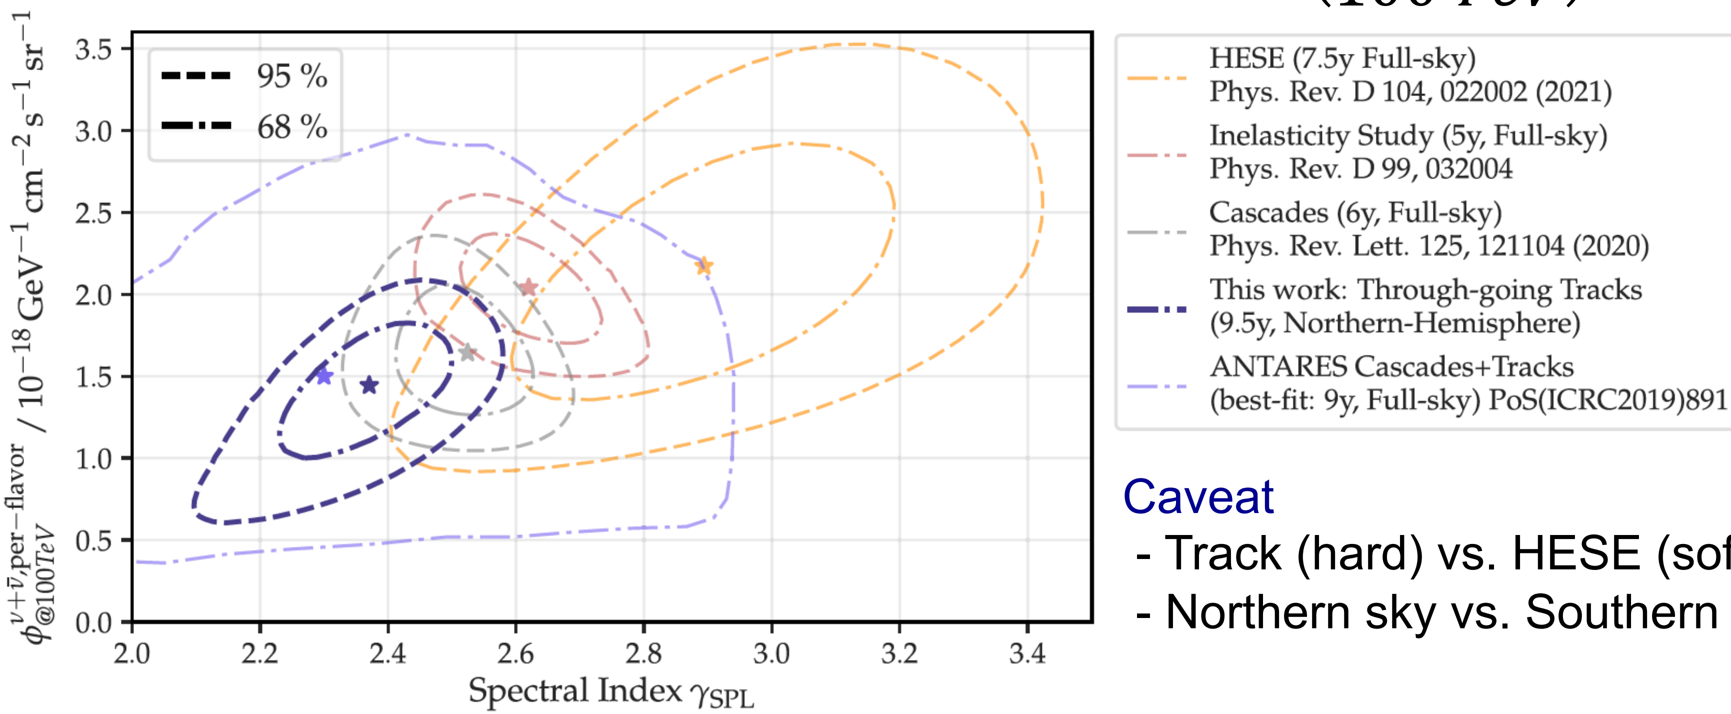


3. High-energy starting event (HESE) sample

60 events in 60-2000 TeV (7.5-yr data)

- Mostly down-going events (Southern sky)
- Not atmospheric and cosmogenic neutrinos
- Flavour structure not understood
- Spectrum not understood

$$\Phi_\nu \sim \phi_{SPL} \cdot \left(\frac{E_\nu}{100\ TeV}\right)^{-\gamma_{SPL}}$$

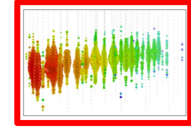


Caveat

- Track (hard) vs. HESE (soft)
- Northern sky vs. Southern sky

IceCube,ApJ,928(2022)50

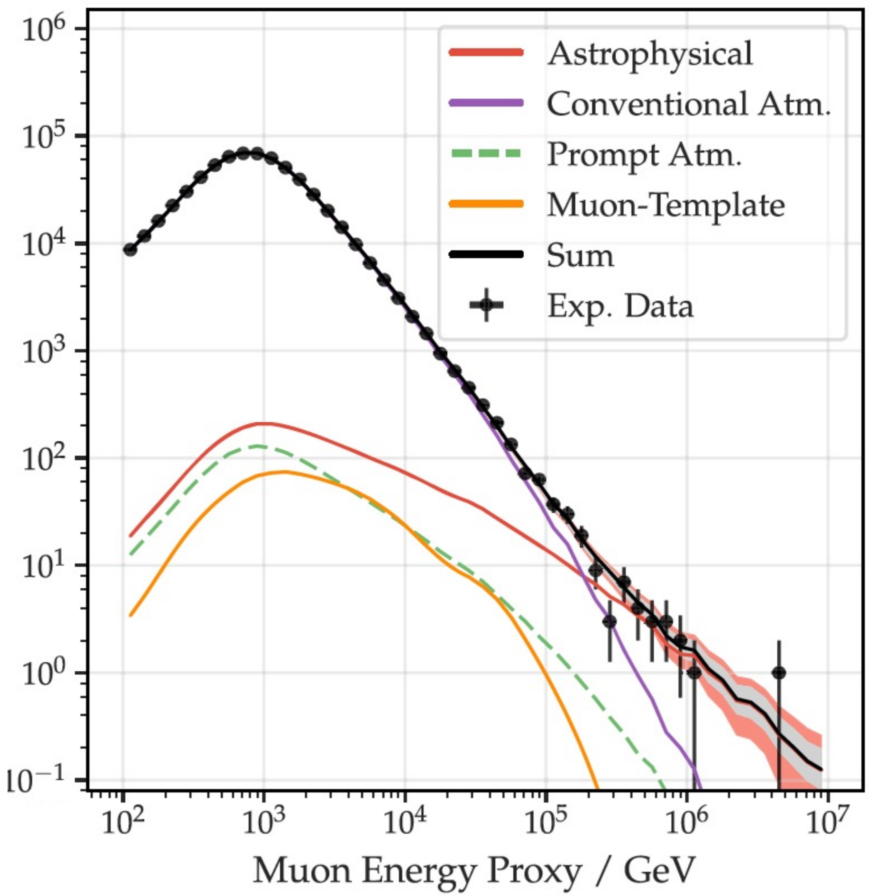
3. Track event sample



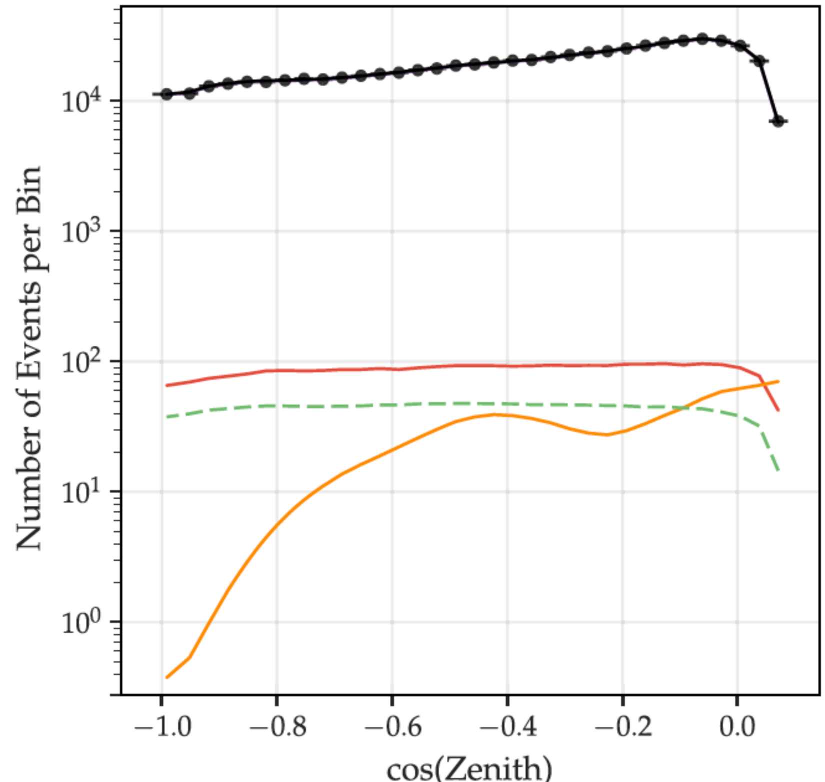
track

35 events >200 TeV (9.5yr data)

- Mostly through-going events
- Mostly up-going events (Northern sky)



Track events

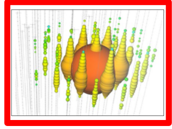


Caveat

- Track (hard) vs. HESE (soft)
- Northern sky vs. Southern sky

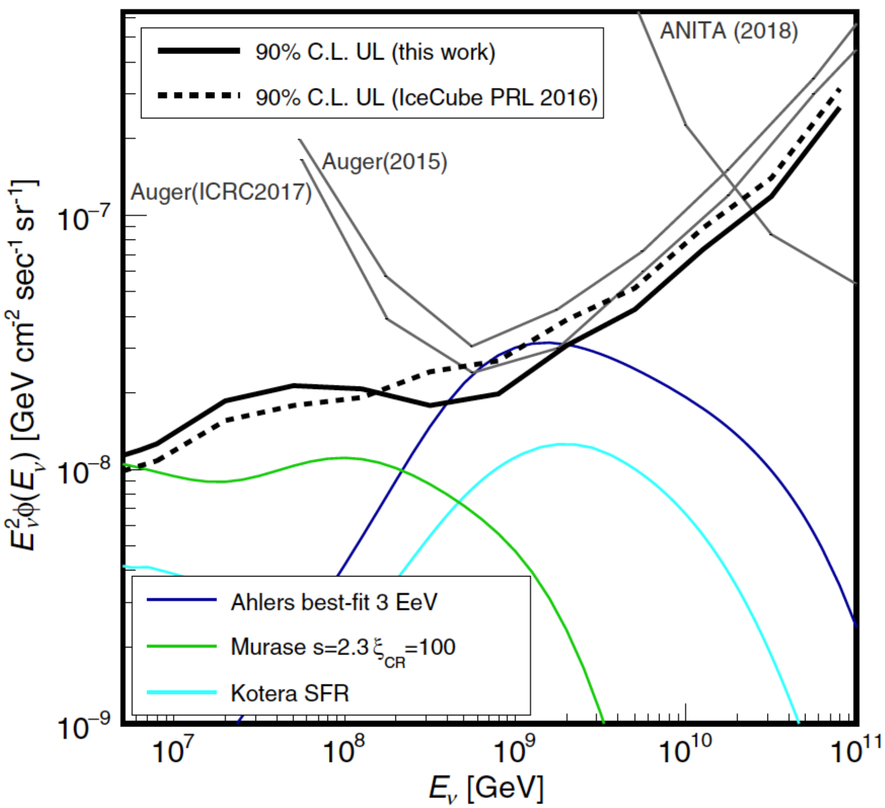
IceCube,PRD98(2018)062003
IceCube-Gen2,J.Phys.G48(2021)060501

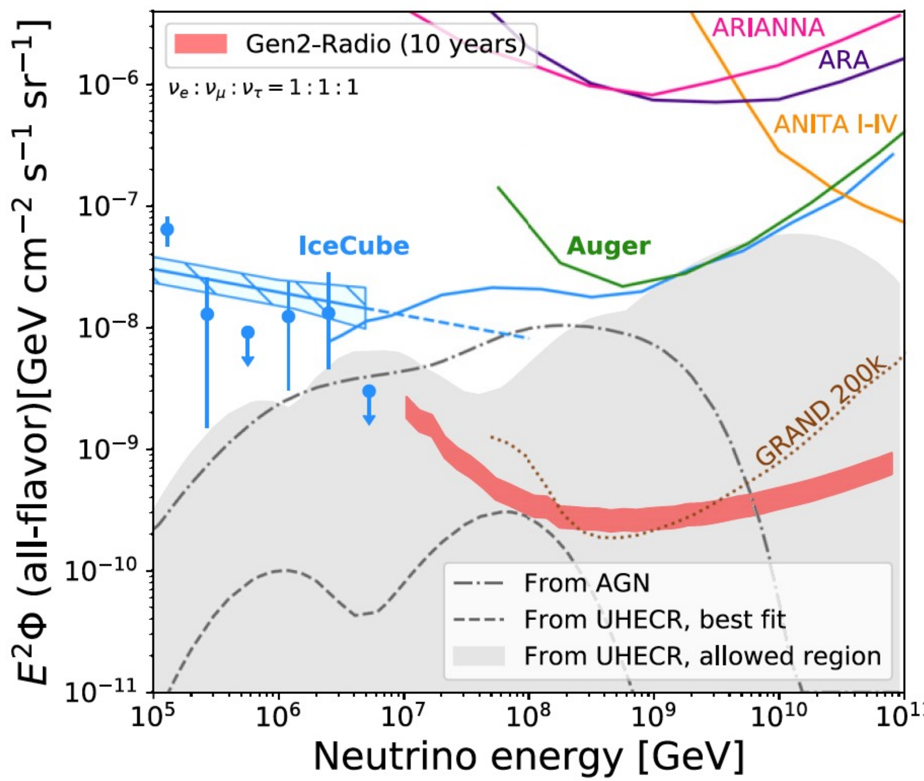
3. Extremely high-energy (EHE) neutrino flux



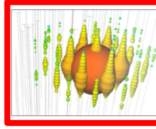
Flux limits

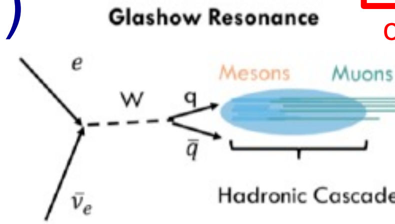
- Flux limit for > 5 PeV neutrinos in IceCube
- Need air shower Cherenkov/radio for > 10 PeV





3. PeV energy partially contained events (PEPE)





Glashow resonance

- With muon front event
- 5.9±0.2 PeV
- Access to neutrino vs. antineutrino

Glashow resonance candidate
“Hydrangea”

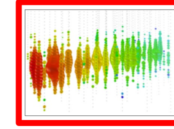
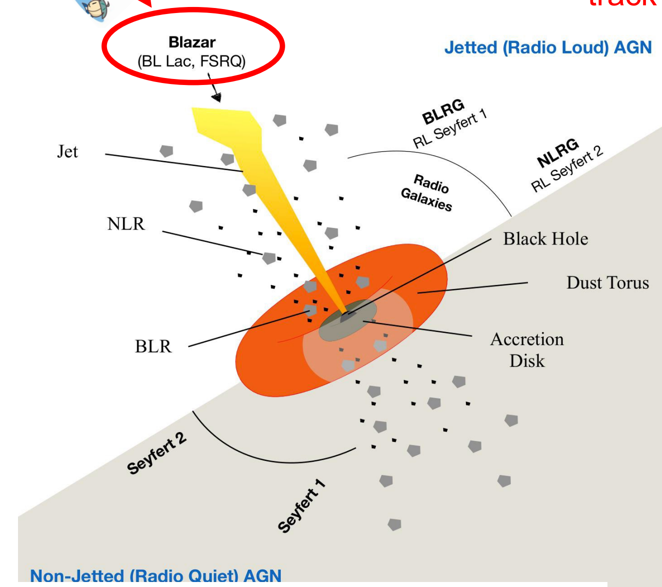
IceCube-san
Higgstan.com



4. AGN neutrinos

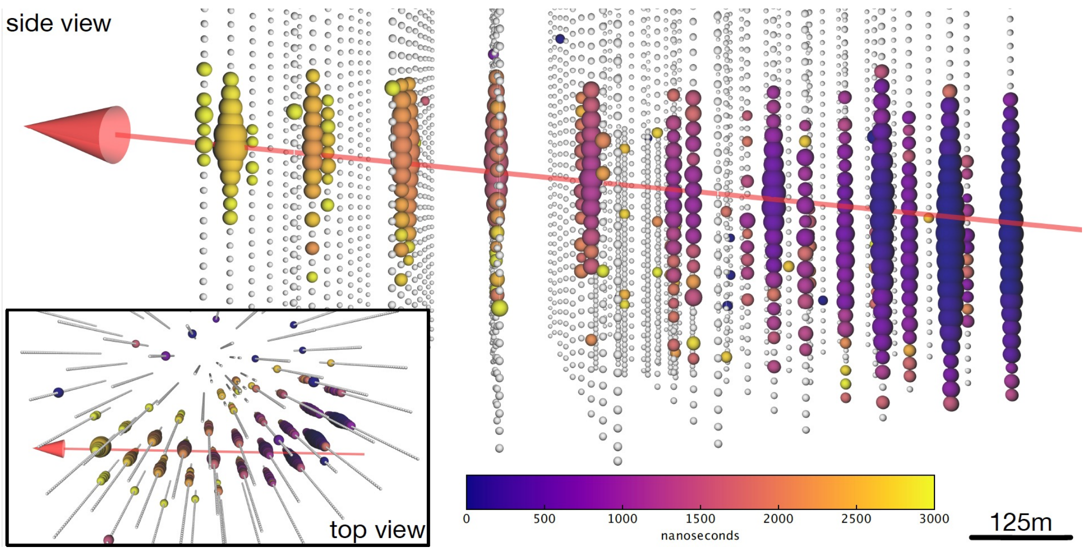


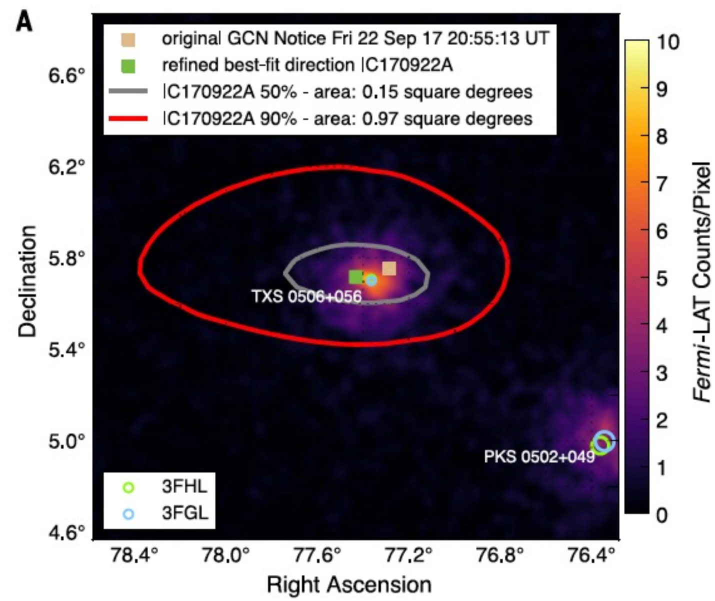
TXS056+0506 (blazar)

- 3rd astrophysical neutrino soource
- 1.8 Gpc (z=0.34)
- One of the brightest blazar

IC170922

- 290 TeV
- Horizontal long track event

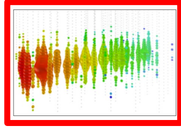




KING'S College LONDON

IceCube, PRL124(2020)051103, Science378(2022)538

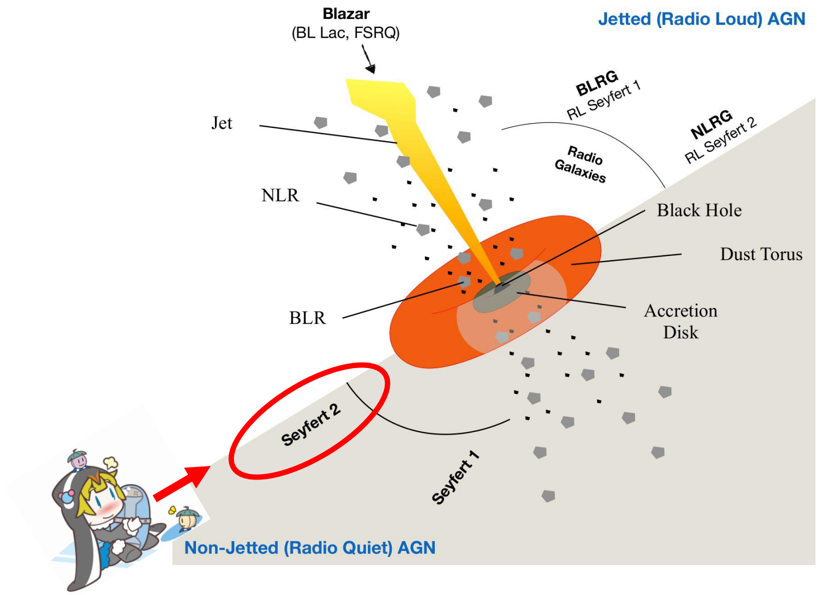
4. AGN neutrinos

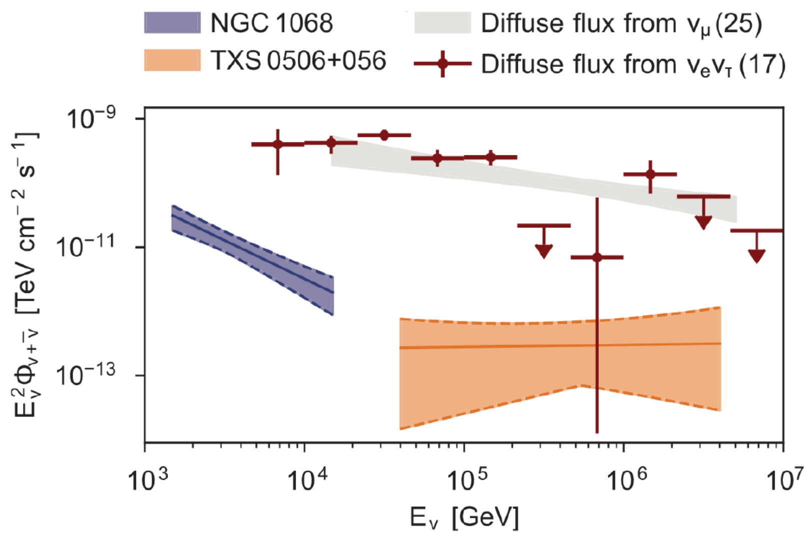


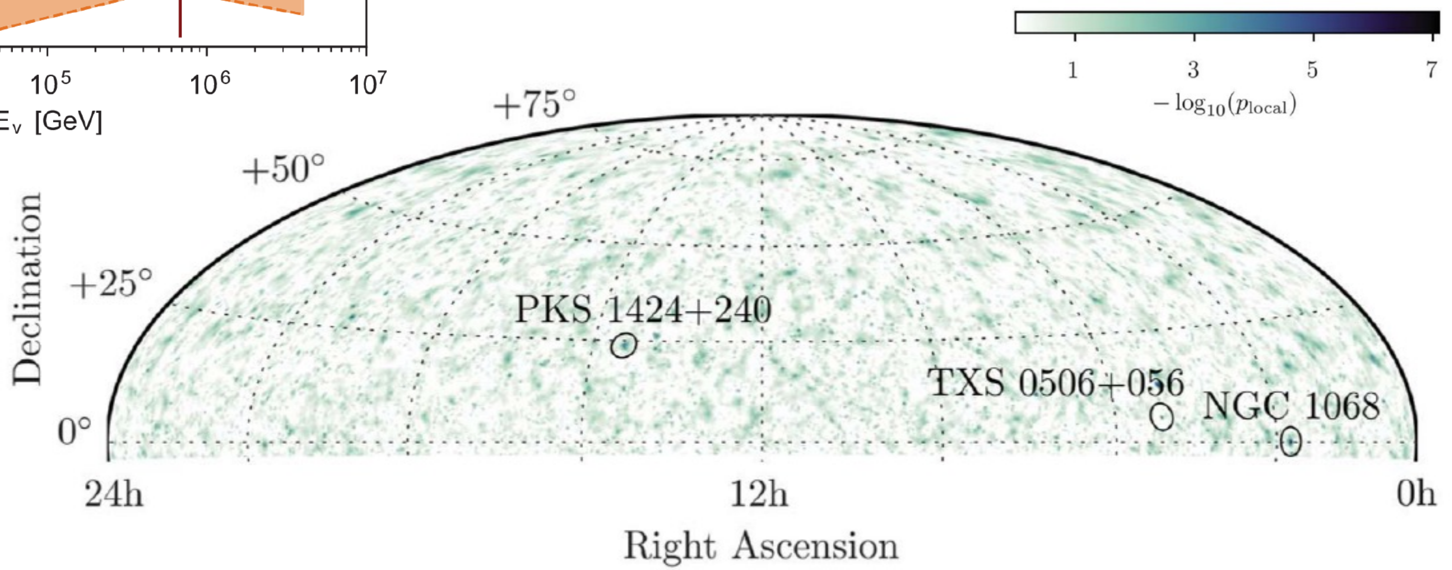
track

NGC1068 (radio galaxy)

- 4^{th} astrophysical neutrino source
- Nearby AGN (14.4Mpc)
- 1.5 – 15 TeV with γ~3.2±0.2



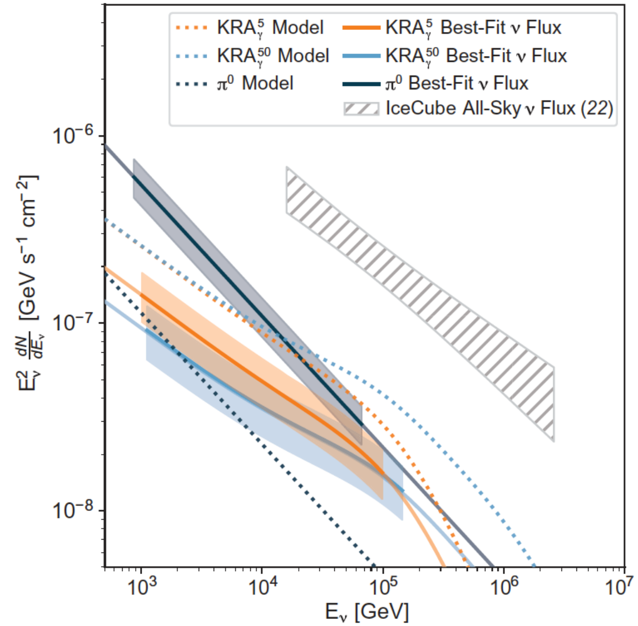


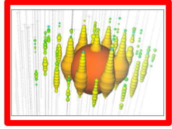


KING'S College LONDON

IceCube, Science 380(2023)1338

4. Galactic neutrinos

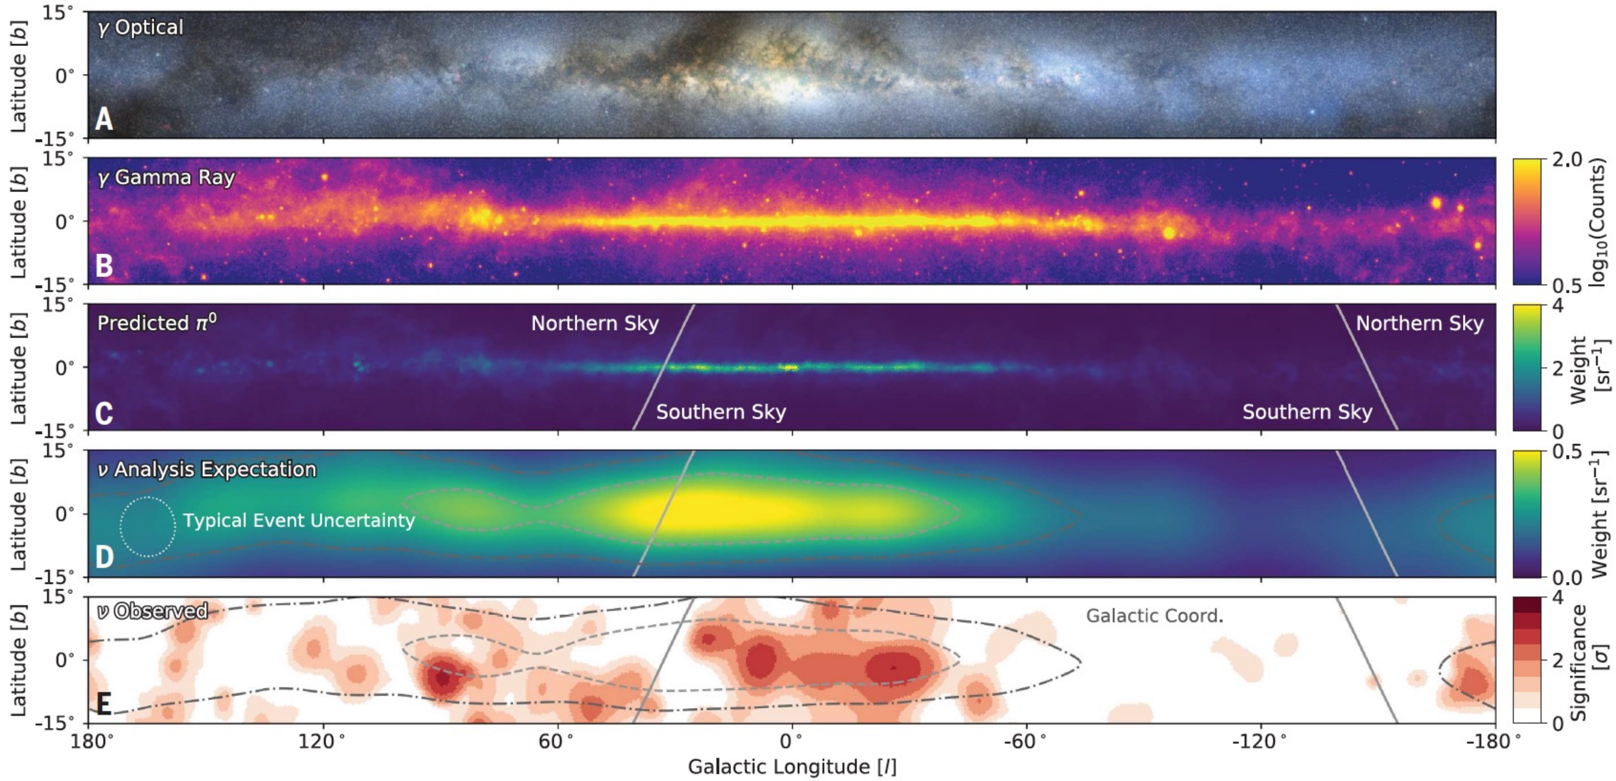




cascade

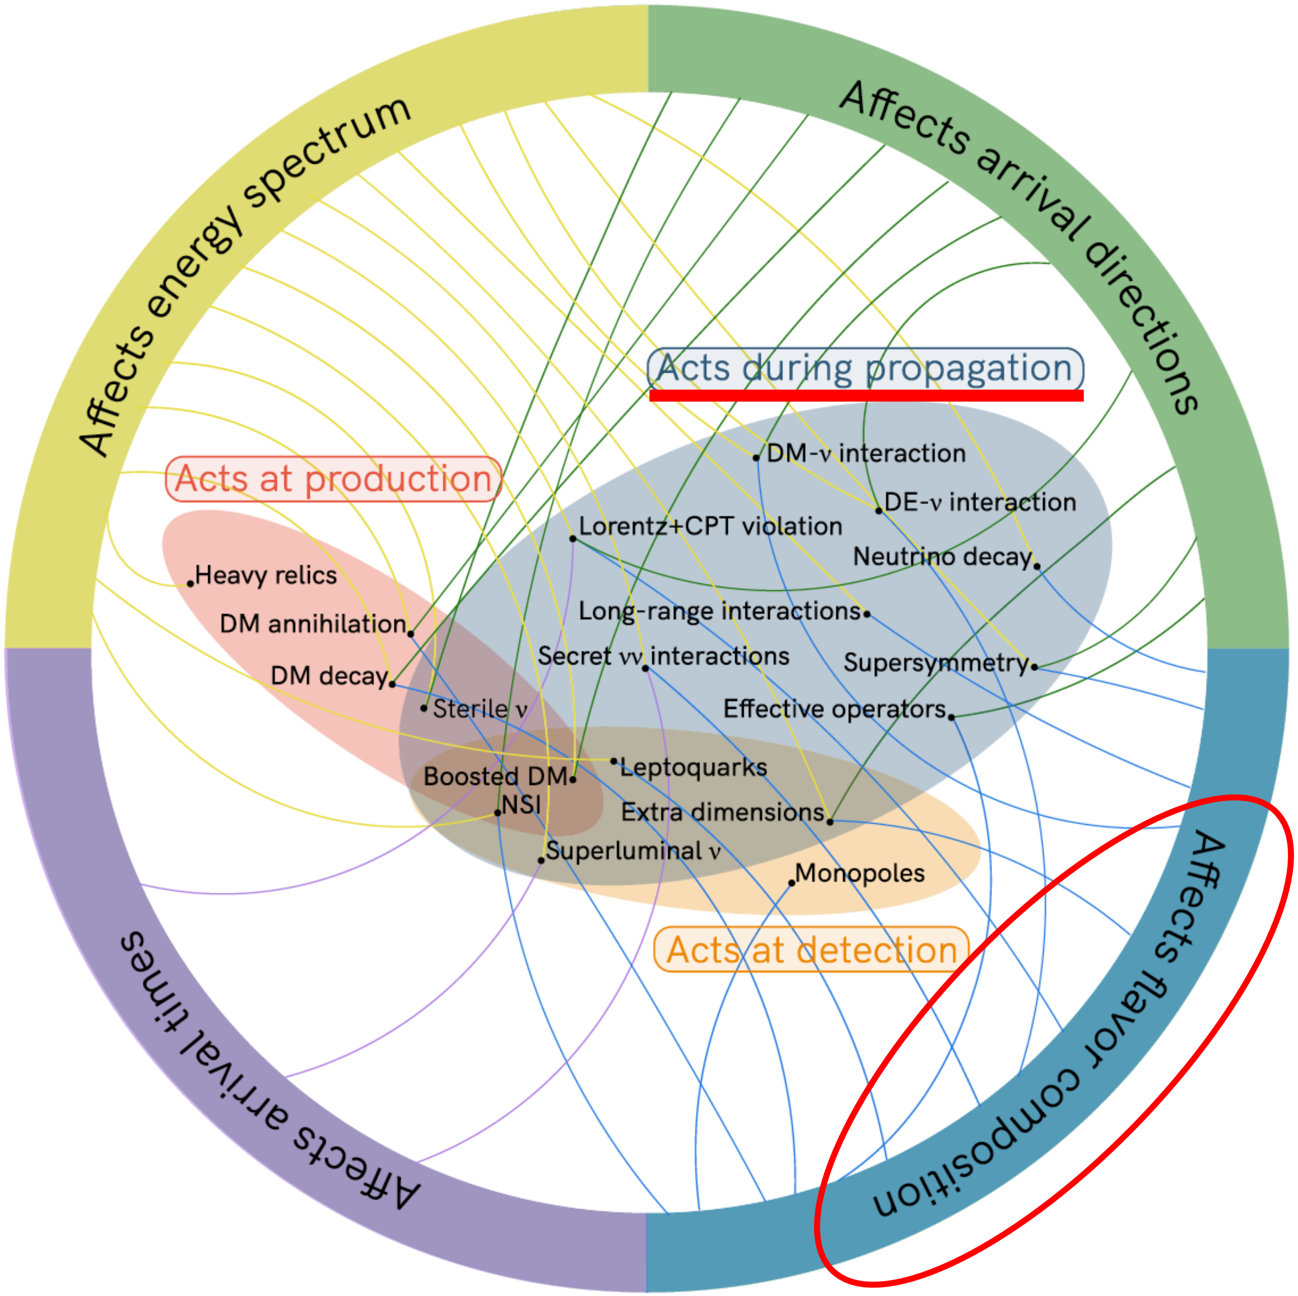
Cascade sample (southern sky)

- 5th astrophysical neutrino source
- Cascade sample + ML reconstruction
- γ~2.5 assumed (π° model)
- Can be improved to identify point sources



KING'S College LONDON

Snowmass21 white paper, “Beyond the Standard Model effect with Neutrino Flavour”, EPJC83(2023)15
Ackermann, Bustamante, Lu et al.JHEA.36(2022)55



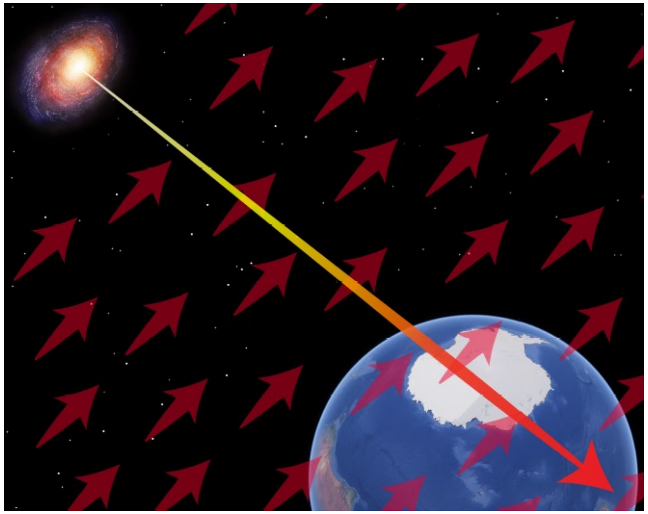
5. Violation of fundamental physics

Neutrino propagation may be affected by quantum-gravity-motivated effects in vacuum, and neutrino properties might be modified
- Energy (spectrum distortion)
- Arrival time (neutrino delay)
- Neutrino flavour (anomalous mixings)

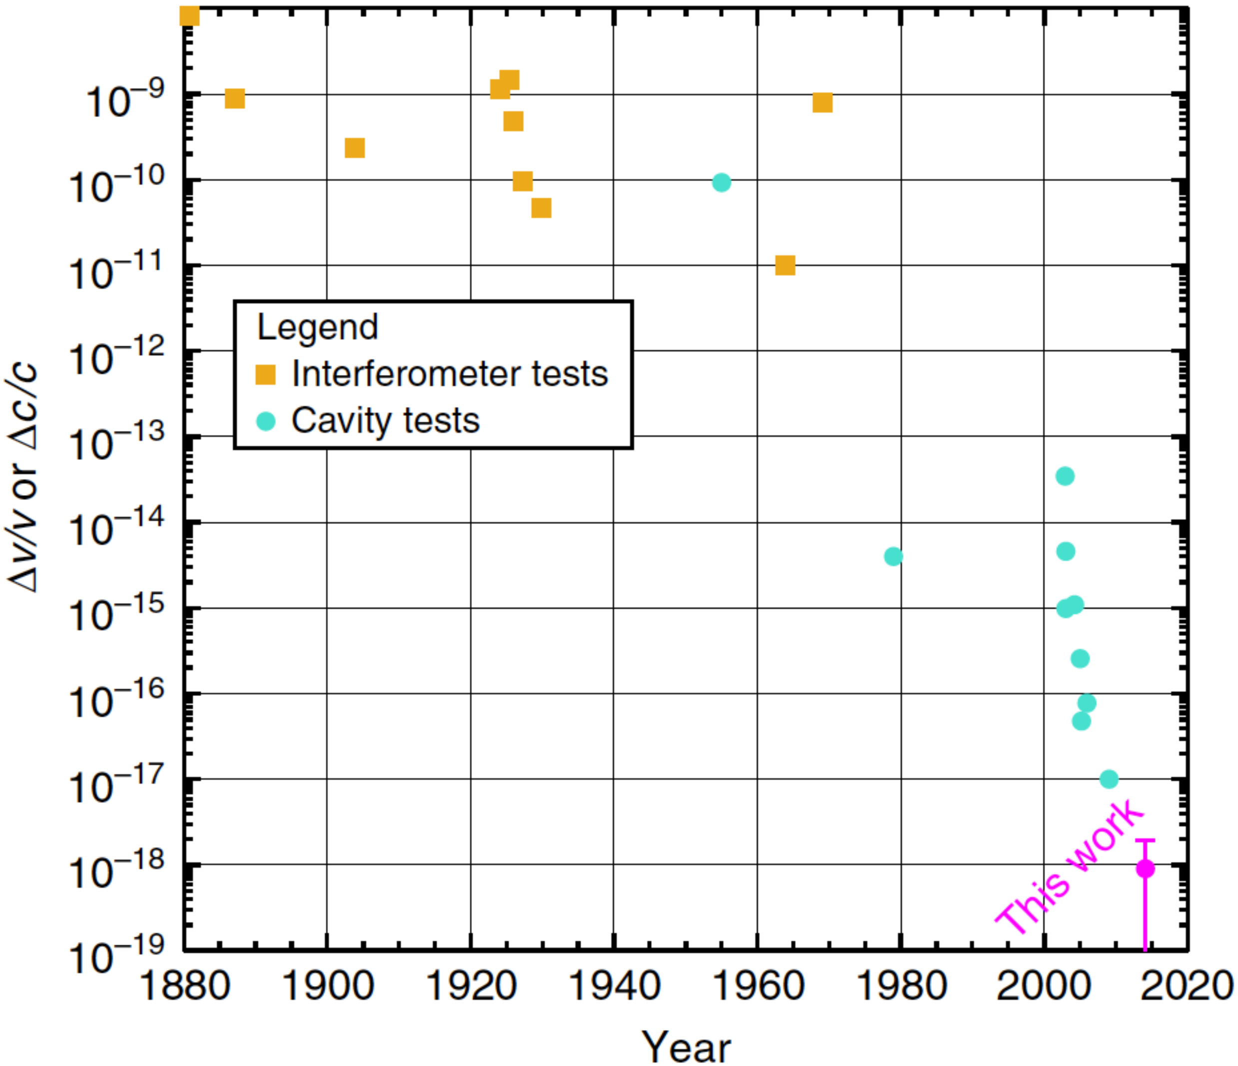
Expected effect is small. We need high-precision measurements to find such new physics

quantum foam
- quantum fluctuation of space-time

Lorentz violating field
- new field saturating the universe (æther)

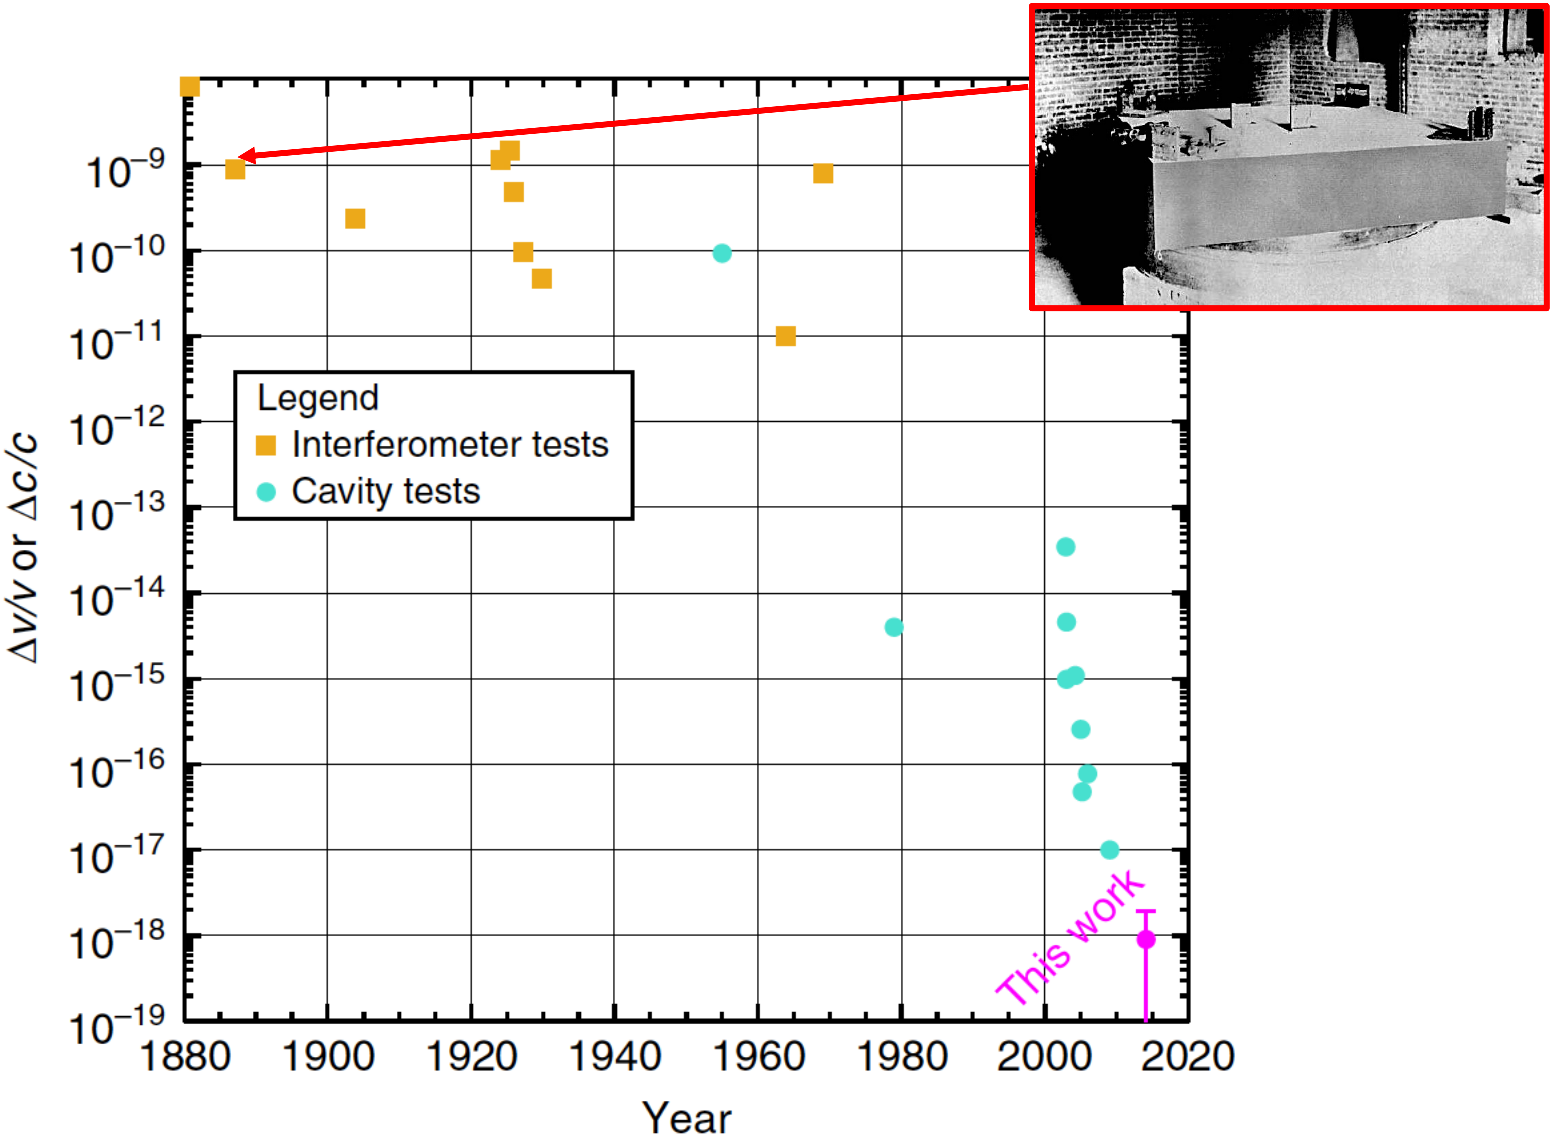


5. History of Michelson-Morley experiment

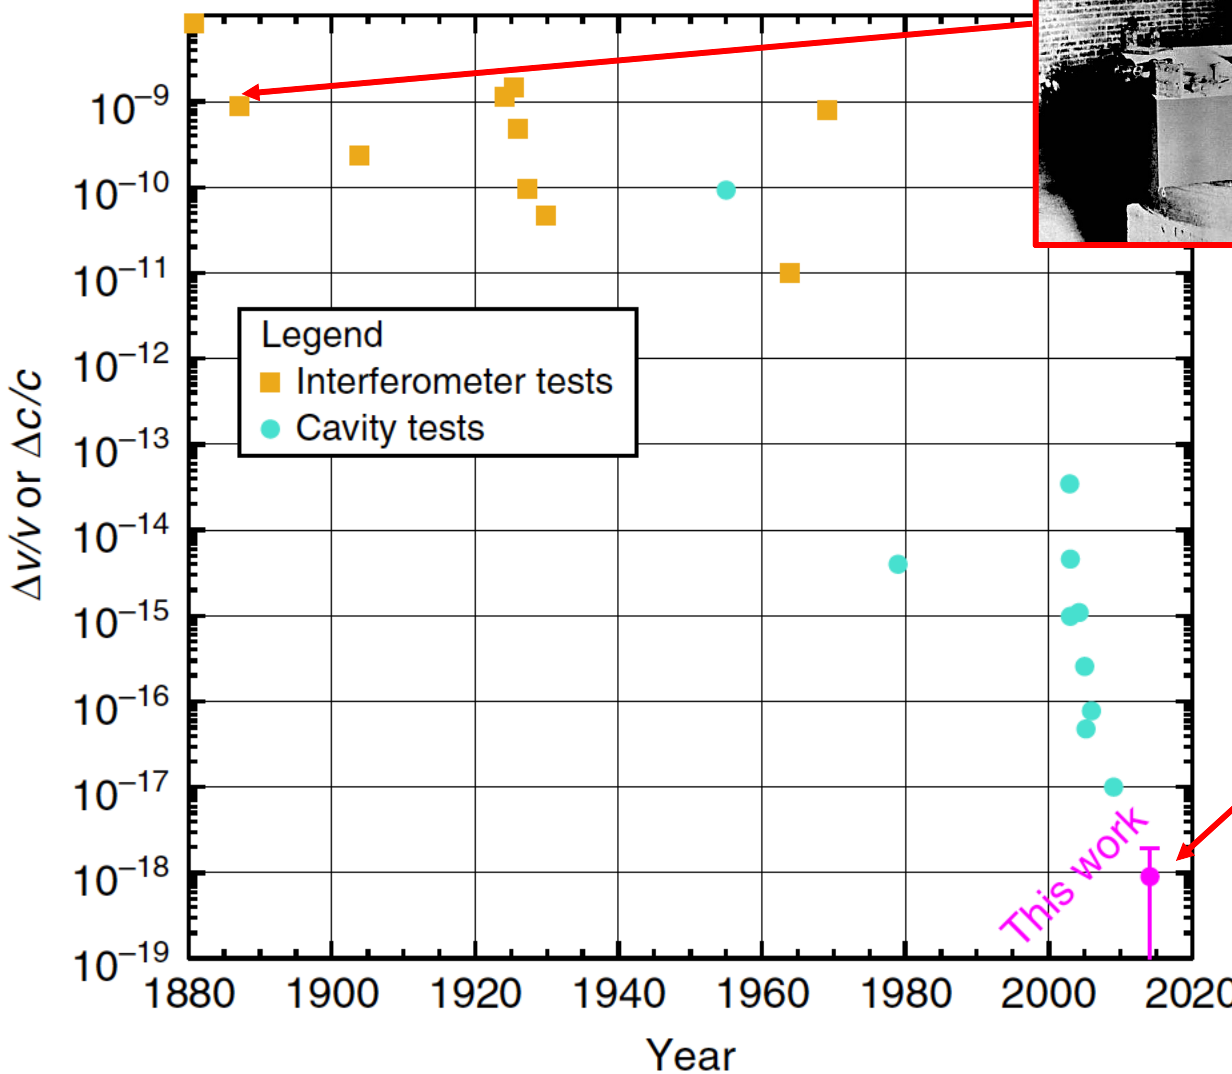


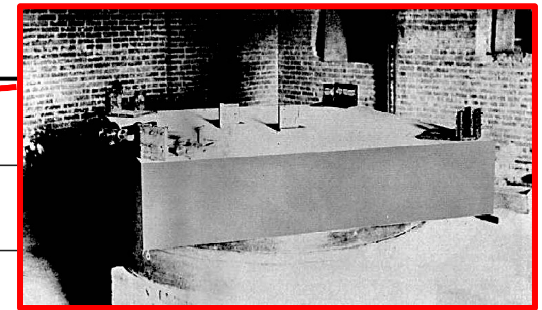
Nagel et al, Nature Comm., 6(2015)8174

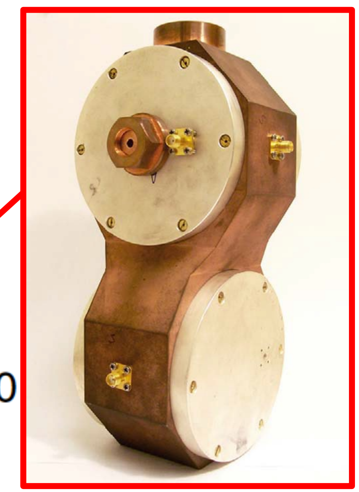
5. History of Michelson-Morley experiment (1887)



5. History of Michelson-Morley experiment (2015)

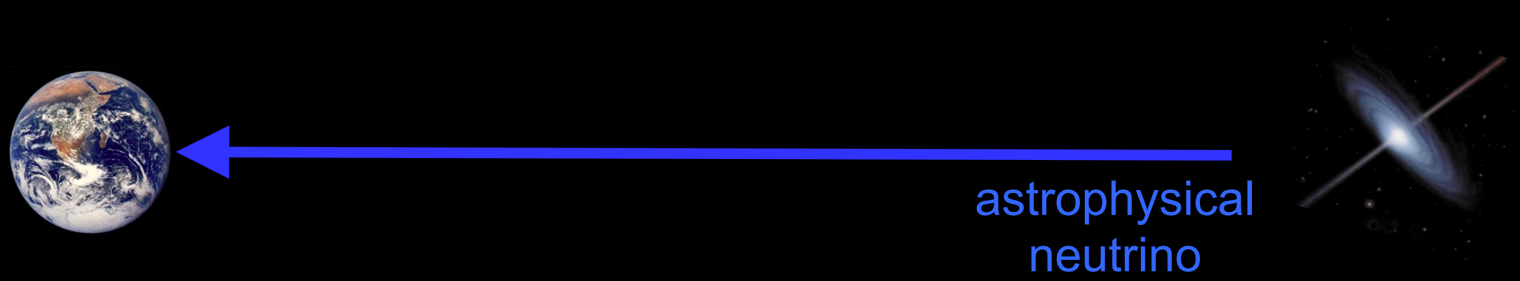






5. High-energy astrophysical neutrinos

High-energy particles (>60 TeV) propagating a long distance (>100 Mpc) in vacuum
- Astrophysical neutrino flavour is sensitive to tiny space-time effect

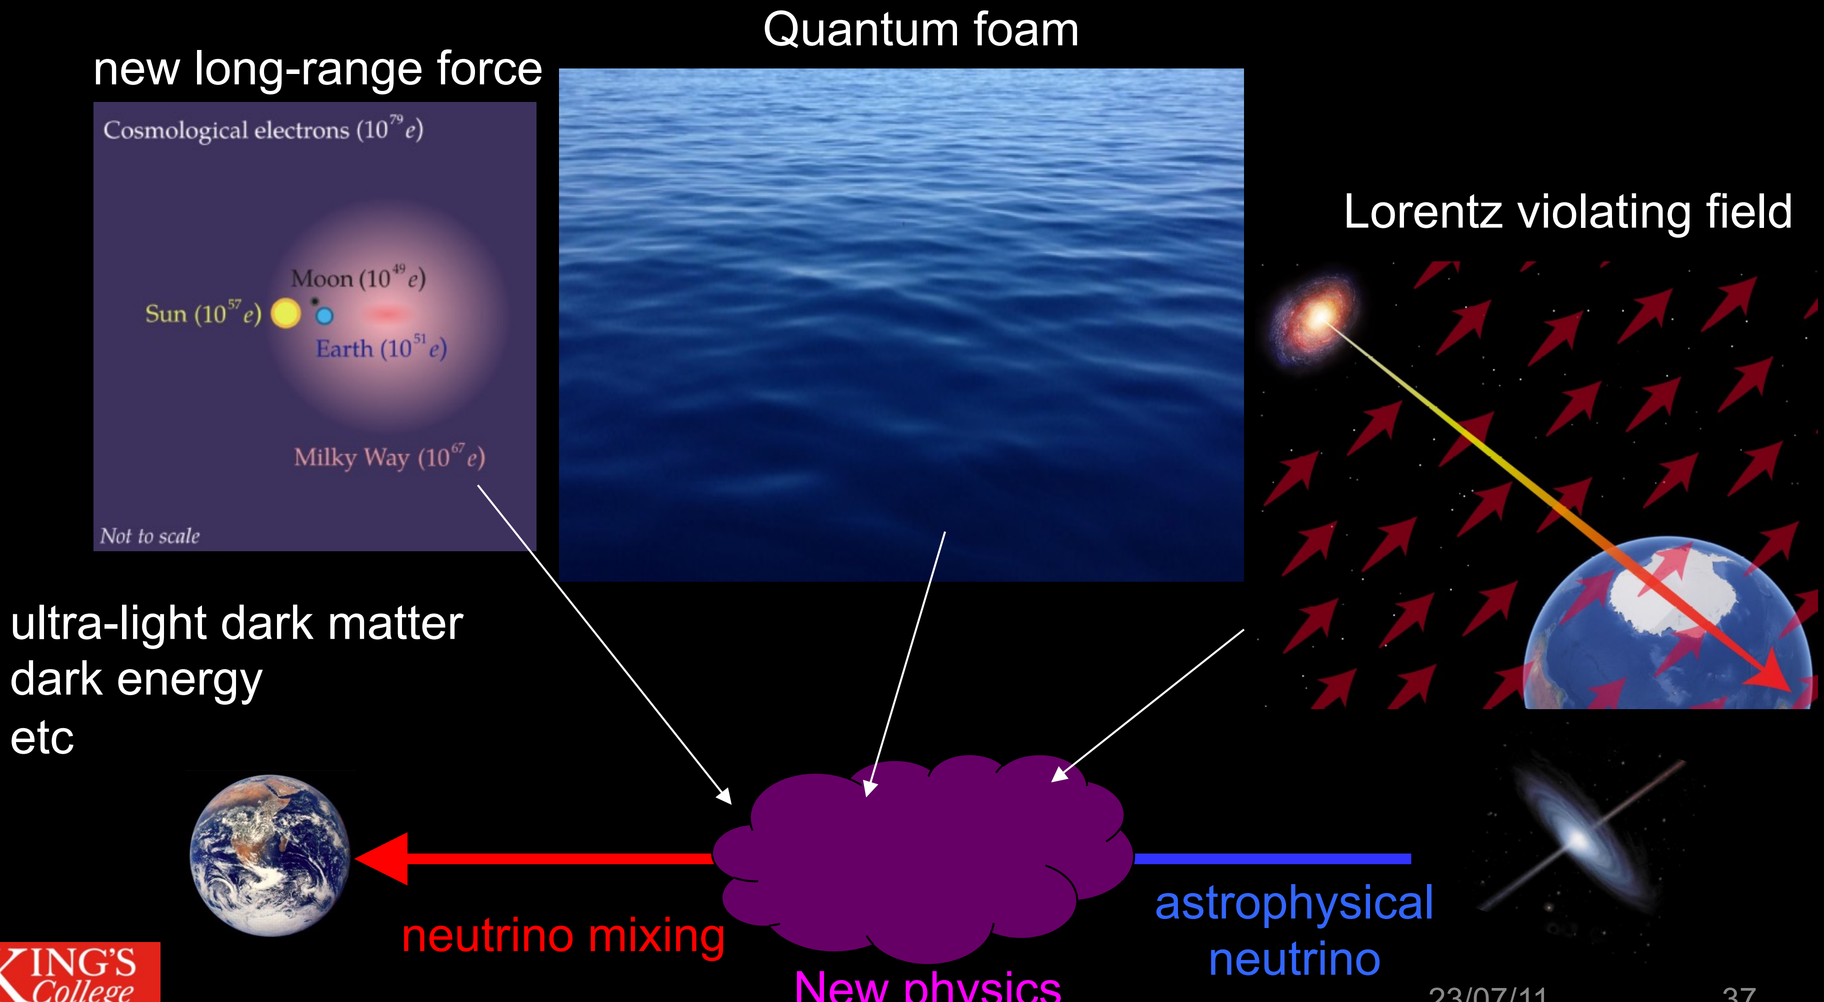


KING'S College LONDON

Snowmass21 white paper, “Beyond the Standard Model effect with Neutrino Flavour”, EPJC83(2023)15

5. High-energy astrophysical neutrinos

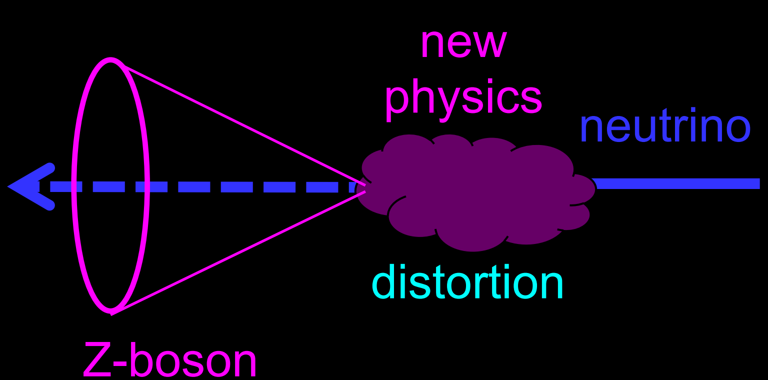
High-energy particles (>60 TeV) propagating a long distance (>100 Mpc) in vacuum
- Astrophysical neutrino flavour is sensitive to tiny space-time effect

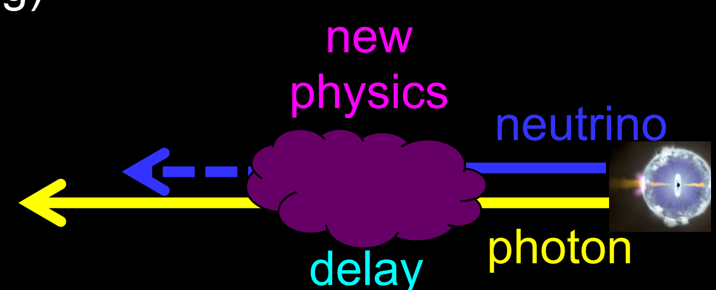


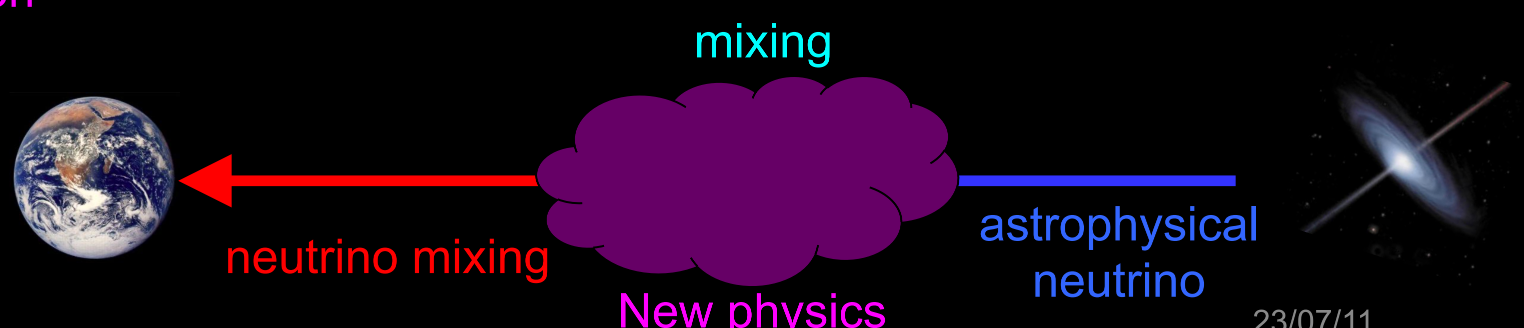
5. Search for QG-motivated effects with astrophysical neutrinos

High-energy particles (>60 TeV) propagating a long distance (>100 Mpc)
- Neutrinos can probe new physics in the universe

New physics search
- Spectrum distortion (vacuum Cherenkov radiation)
- Time of Flight (modified dispersion)
- New flavour structure (anomalous mixing)







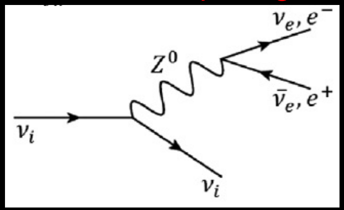
KING'S College LONDON

5. Search for QG-motivated effects with astrophysical neutrinos

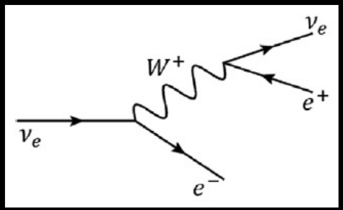
High-energy particles (>60 TeV) propagating a long distance (>100 Mpc)
- Neutrinos can probe new physics in the universe

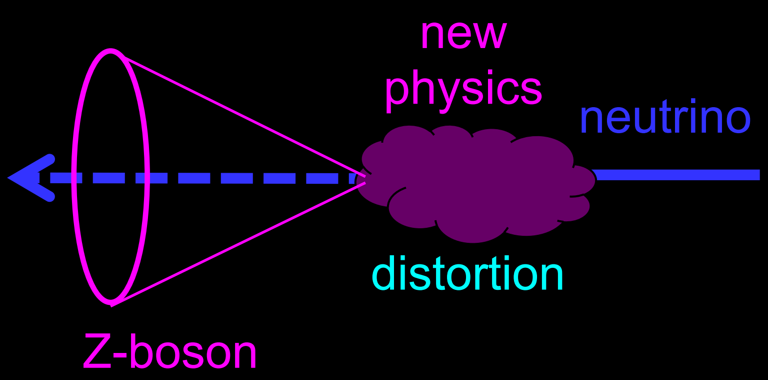
New physics search
- Spectrum distortion (vacuum Cherenkov radiation)
- Time of Flight (modified dispersion)
- New flavour structure (anomalous mixing)

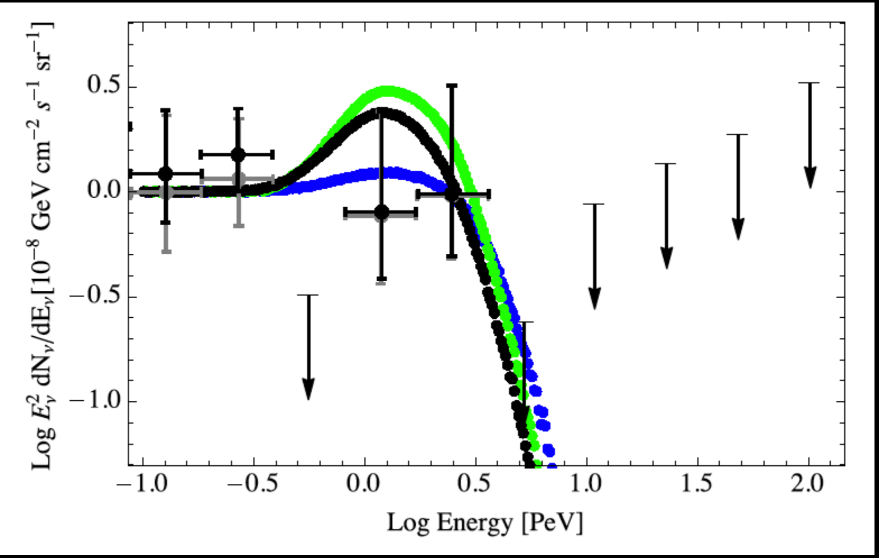
neutrino splitting



vacuum pair emission







Lorentz violating field cause
Cherenkov radiation in vacuum

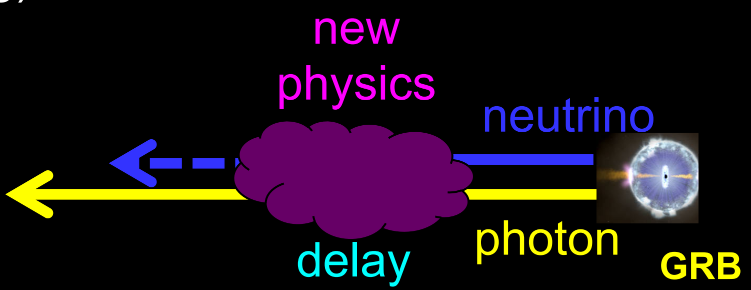
Neutrino spectrum with new physics

KING'S College LONDON

5. Search for QG-motivated effects with astrophysical neutrinos

High-energy particles (>60 TeV) propagating a long distance (>100 Mpc)
- Neutrinos can probe new physics in the universe

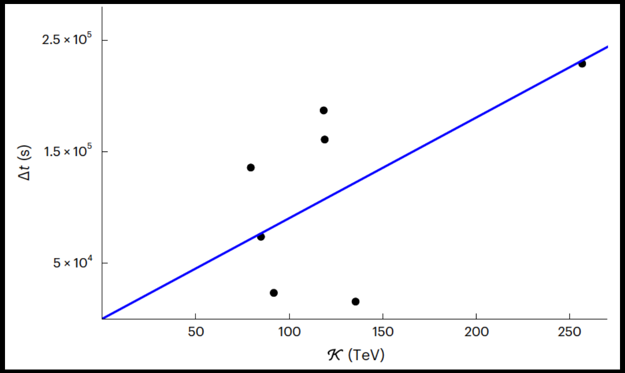
New physics search
- Spectrum distortion (vacuum Cherenkov radiation)
- Time of Flight (modified dispersion)
- New flavour structure (anomalous mixing)



Modified dispersion due to quantum foam cause unexpected delay/advance for neutrinos

$$E^2 = p^2 + m^2 \pm p^2 \left(\frac{p}{M_{QG,n}}\right)^n$$

$$\Delta t = \eta D(1) \frac{K(E,Z)}{M_P}$$



KING'S College LONDON

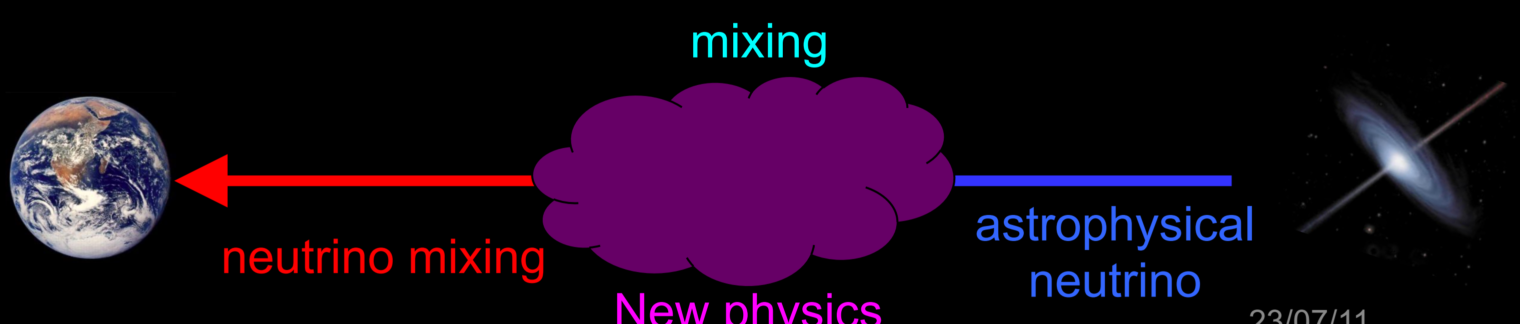
Argüelles, TK, Salvado, PRL115(2015)161303
Bustamante, Beacom, Winter, PRL115(2015)161302

5. Search for QG-motivated effects with astrophysical neutrinos

High-energy particles (>60 TeV) propagating a long distance (>100 Mpc)
- Neutrinos can probe new physics in the universe

New physics search
- Spectrum distortion (vacuum Cherenkov radiation)
- Time of Flight (modified dispersion)
- New flavour structure (anomalous mixing)

Flavour effect
- Macroscopic quantum effect and sensitive to small effects



KING'S College LONDON

5. Search for QG-motivated effects with astrophysical neutrinos

Standard Model Extension (SME) is an effective field theory to look for Lorentz violation

Standard Model | New physics

$$L = i\bar{\psi}\gamma^{\mu}\partial_{\mu}\psi - m\bar{\psi}\psi + \bar{\psi}\gamma^{\mu}a_{\mu}\,\psi + \bar{\psi}\gamma^{\mu}c_{\mu\nu}\partial^{\nu}\psi \cdots$$

Effective Hamiltonian can be written from here

Standard Model | New physics (renormalizable) | higher dimension operator (non-renormalizable)

$$h_{eff} \sim \frac{1}{2E}U^{\dagger}M^{2}U + a^{(3)}_{\alpha\beta} - Ec^{(4)}_{\alpha\beta} + E^{2}a^{(5)}_{\alpha\beta} - E^{3}c^{(6)}_{\alpha\beta} \cdots$$

IceCube is sensitive to higher dimension operators

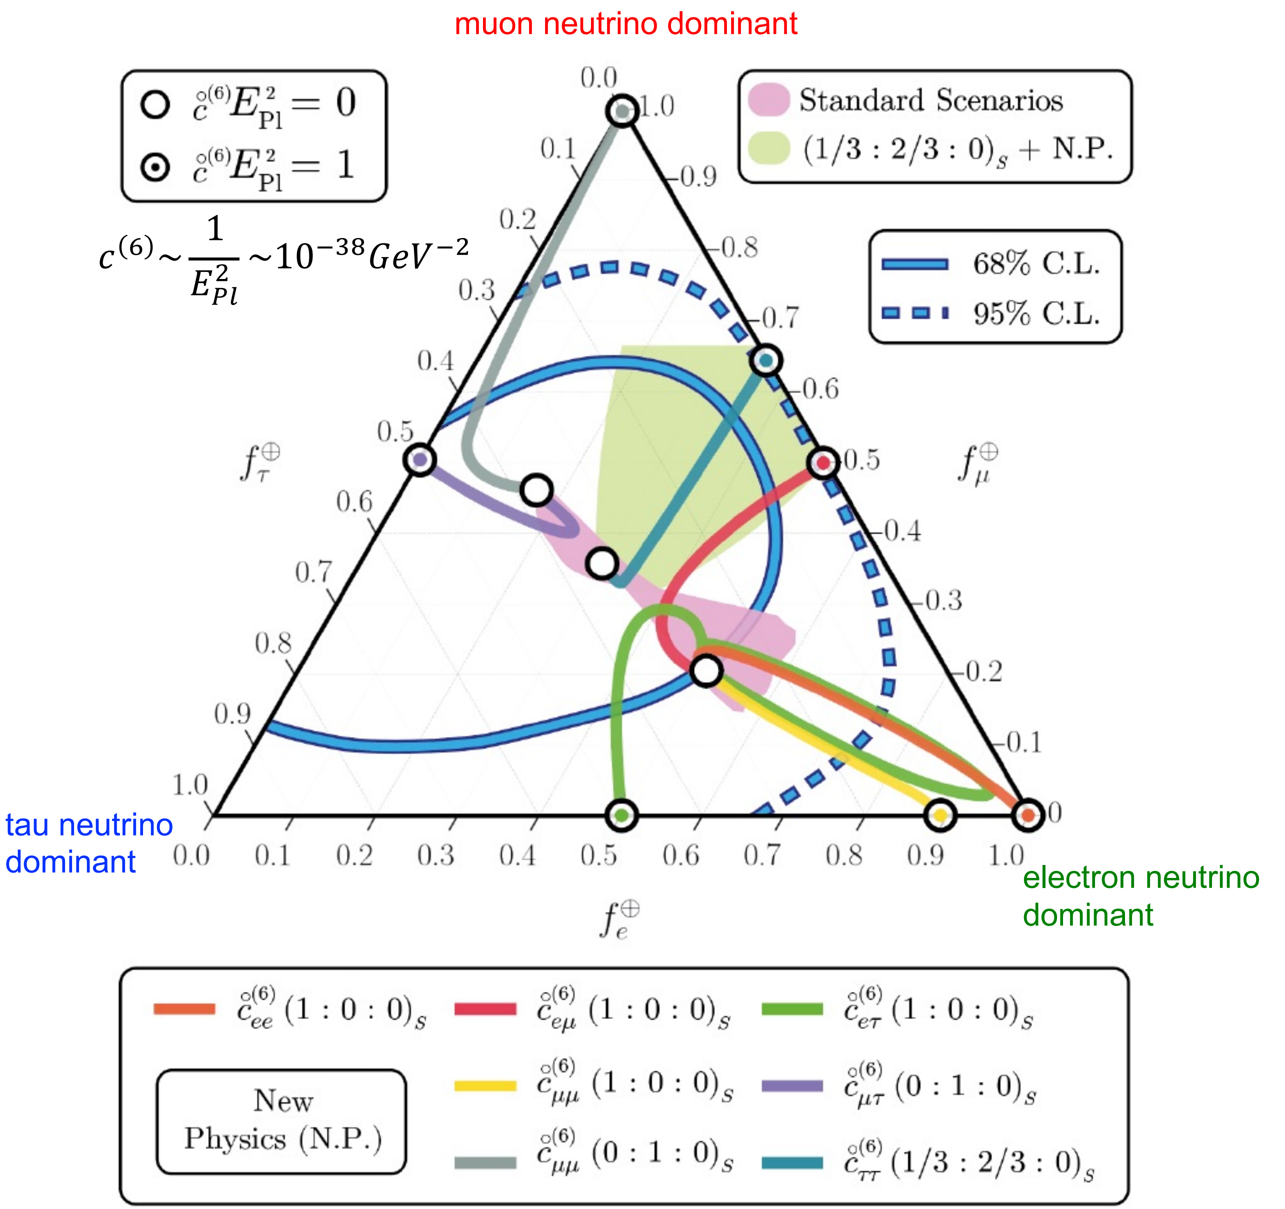
$$E^{3}c^{(6)}_{\alpha\beta} = E^{3}\begin{pmatrix} c^{(6)}_{ee} & c^{(6)}_{e\mu} & c^{(6)}_{\tau e} \\ c^{(6)*}_{e\mu} & c^{(6)}_{\mu\mu} & c^{(6)}_{\mu\tau} \\ c^{(6)*}_{\tau e} & c^{(6)*}_{\mu\tau} & c^{(6)}_{\tau\tau} \end{pmatrix}$$

dimension-6 operator natural scale: $c^{(6)} \sim \frac{1}{M^{2}_{Planck}} \sim 10^{-38}GeV^{-2}$

5. Flavor ratio

Nonzero new physics moves standard predictions ○ to different locations ⊙ depending on the types of new physics operators.

If the new physics models bring the standard predictions outside of the data contour, such model can be rejected by current data

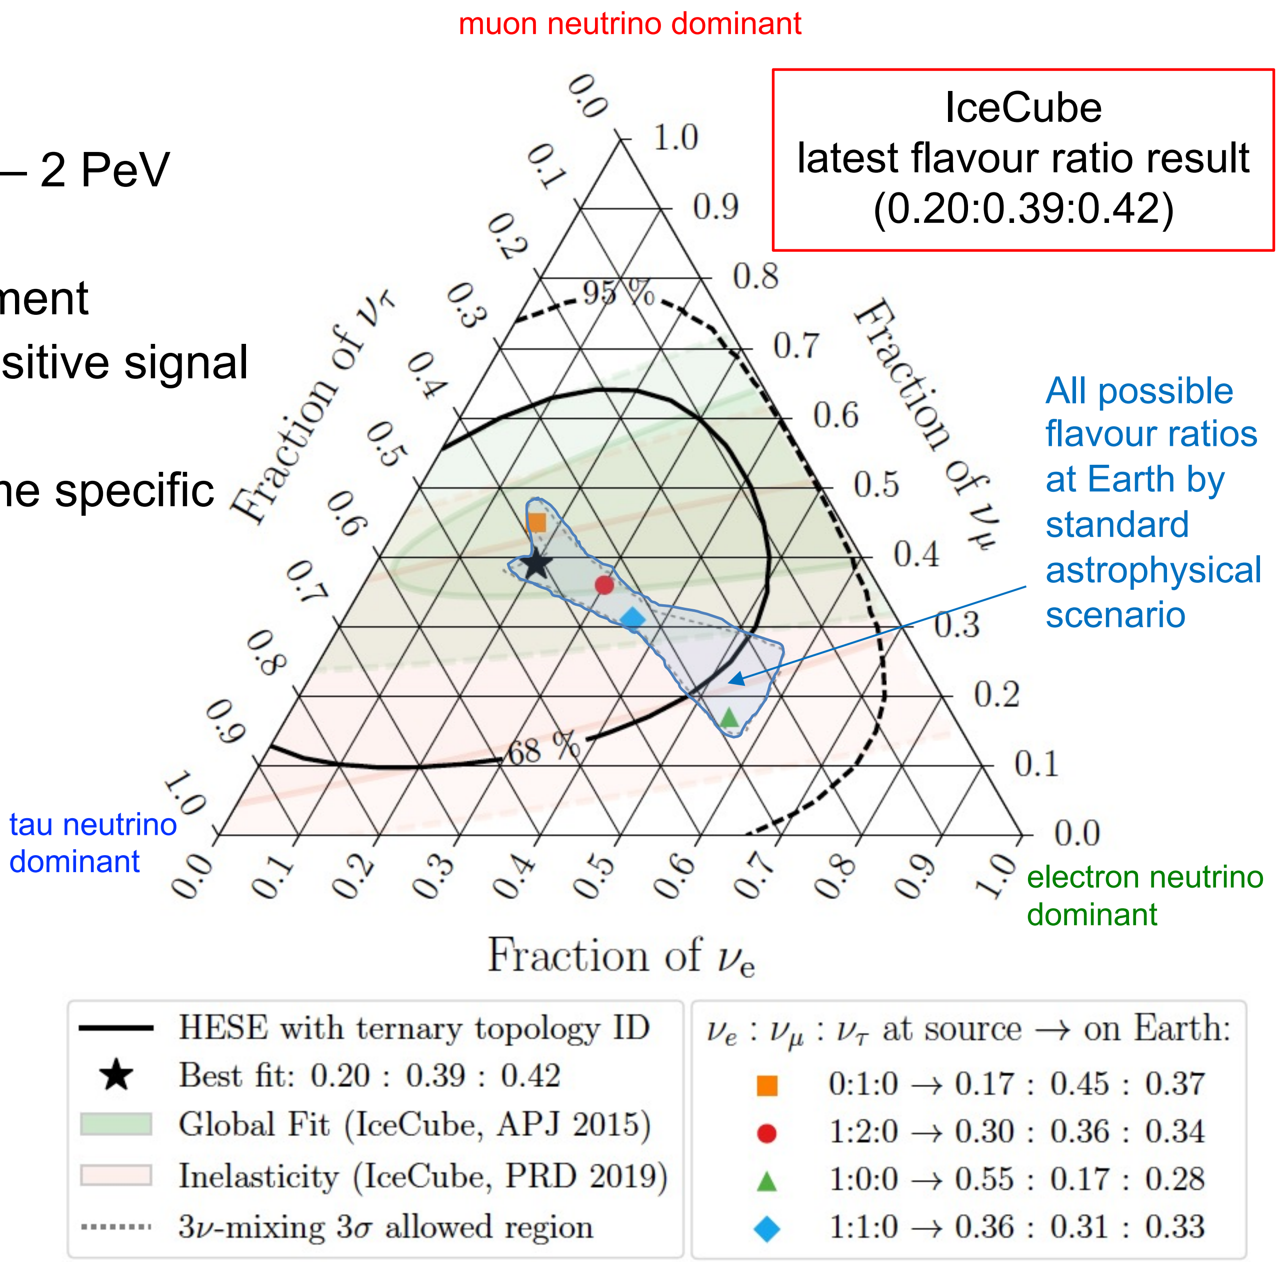


5. Flavor ratio

60 HESE events in 60 TeV – 2 PeV

New flavour ratio measurement
- contour is very big, no positive signal of new physics
- Data are used to test some specific new physics models

We focus on setting limits on certain SME coefficients



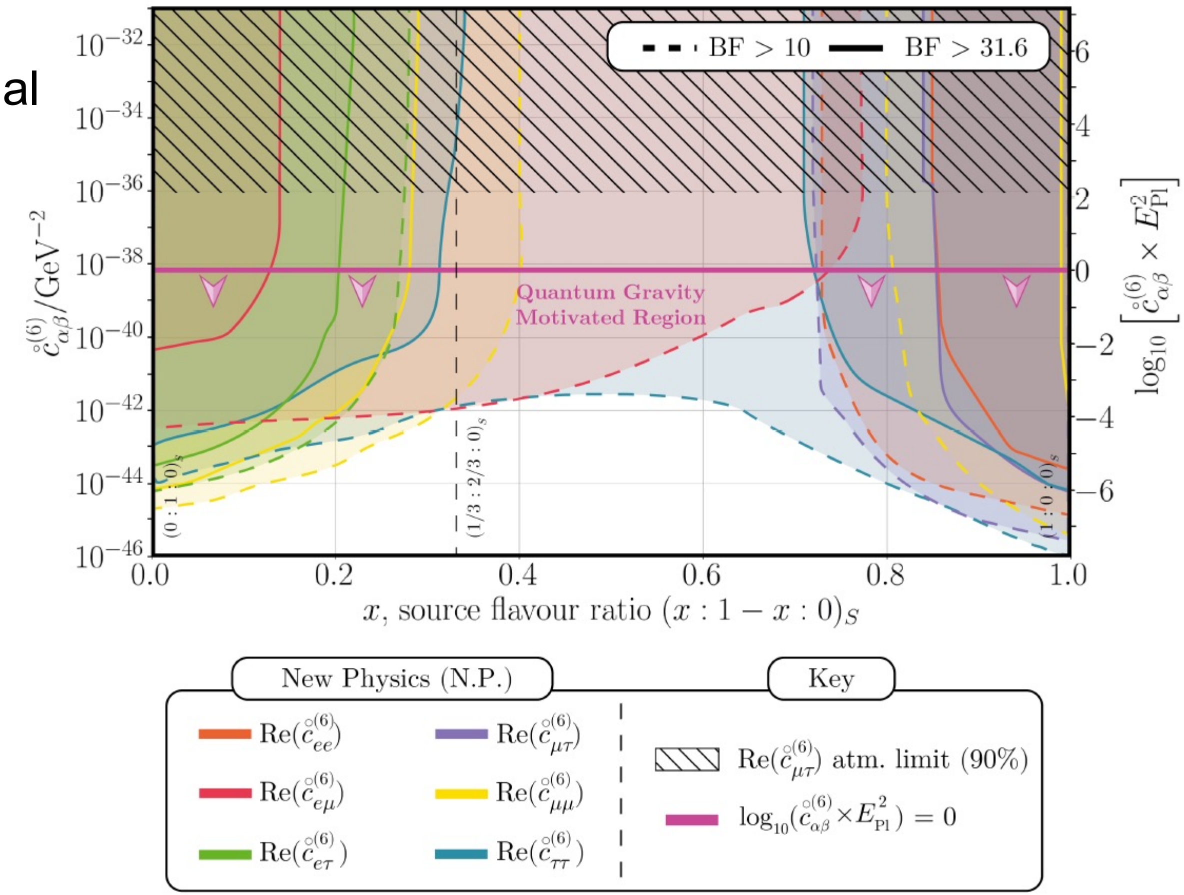
5. HESE 7.5-yr flavor Lorentz violation search

60 HESE events in 60 TeV – 2 PeV

IceCube data start to explore quantum gravity-motivated signal region for some parameters

$$c^{(6)} \leq \frac{1}{M_{Planck}^2} \sim 10^{-38} GeV^{-2}$$

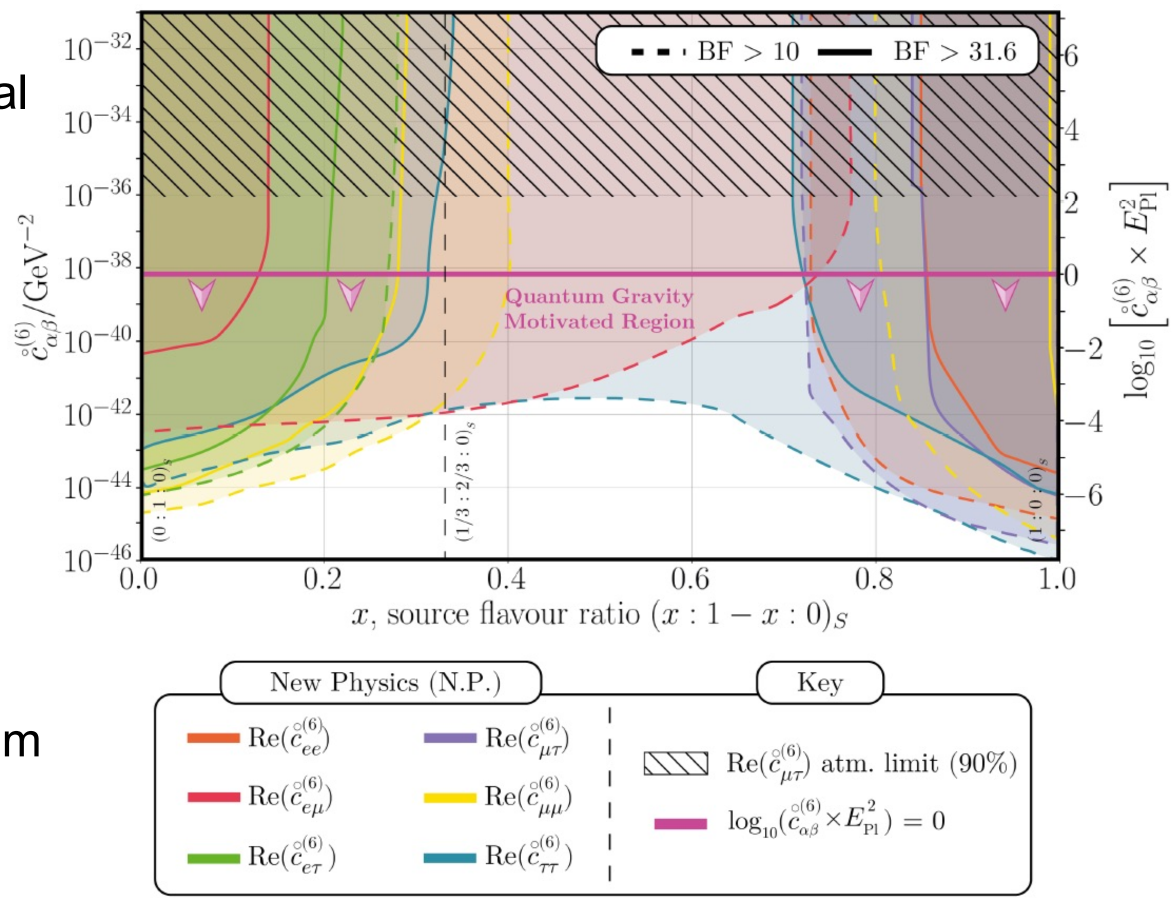
dim-6 new physics operator limit



5. HESE 7.5-yr flavor Lorentz violation search

60 HESE events in 60 TeV – 2 PeV

dim-6 new physics operator limit



IceCube data start to explore quantum gravity-motivated signal region for some parameters

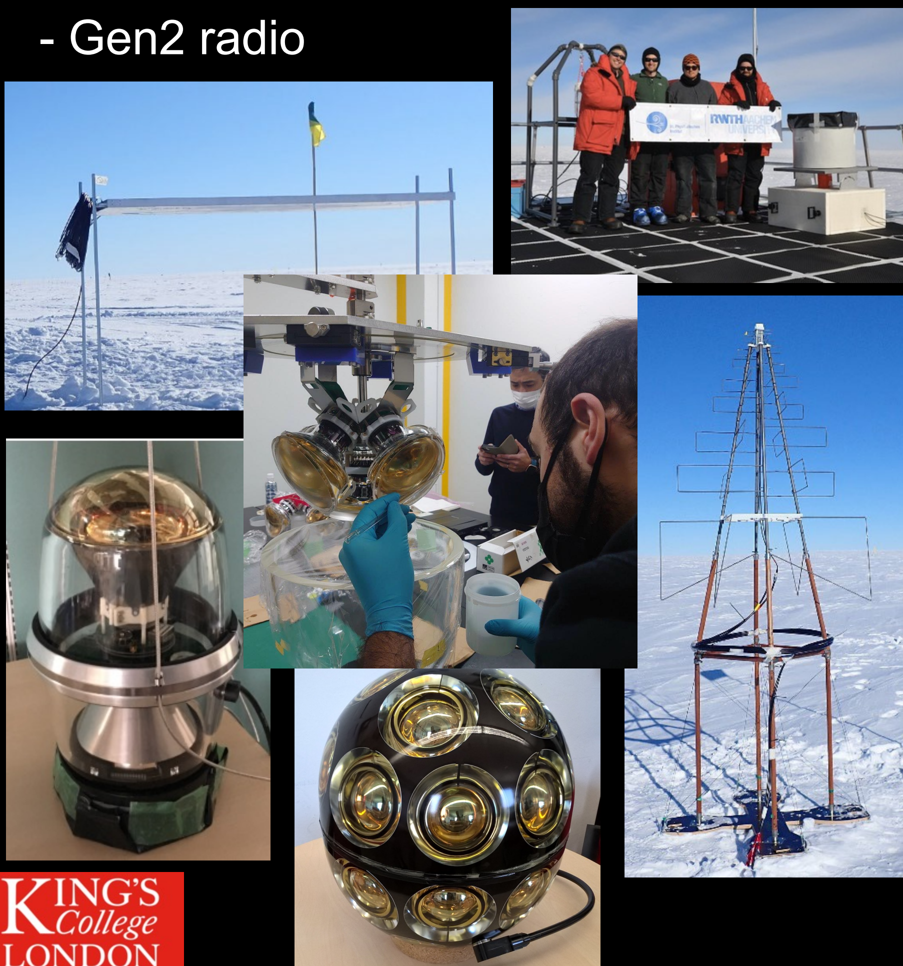
$$c^{(6)} \leq \frac{1}{M^2_{Planck}} \sim 10^{-38} GeV^{-2}$$

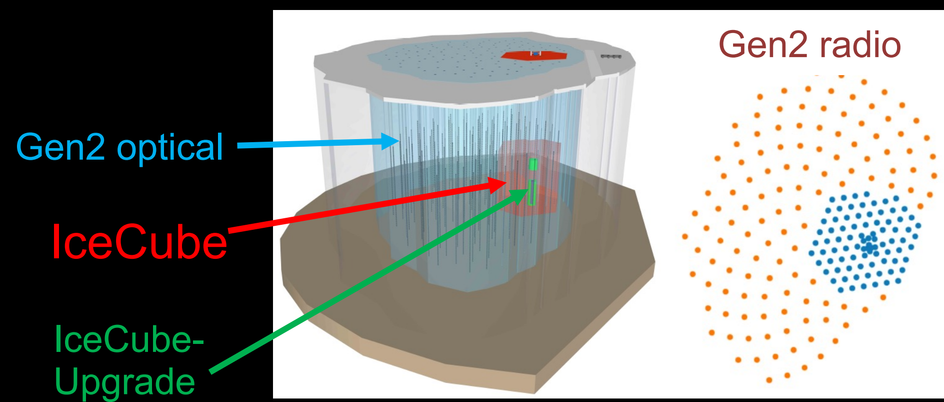
So far, IceCube neutrinos don't show the evidence of quantum gravity

1. quantum gravity is wrong
2. Multi-messenger astronomy
3. Flavour identification algorithm
4. More data

3. IceCube-Gen2

larger separation (125m → ~200-300m) to cover larger volume (x8)
R&D is underway
- Gen2 optical
- Gen2 surface
- Gen2 radio





The first stage of Gen2 (IceCube upgrade) is ongoing

Conclusion

Quantum gravity may create a new effect on neutrinos in vacuum.

High-energy astrophysical neutrino observed at IceCube are powerful tools to look for quantum-gravity-motivated new physics.

Astrophysical neutrino flavour structure is used to look for quantum-gravity-motivated effect in IceCube. The results can be improved in near future.

5. Neutrino flavor ratio ($\nu_e : \nu_\mu : \nu_\tau$)

Astrophysical neutrino production mechanism is not known → production flavour ratio is not known

Flavour ratio on Earth is different due to mixing by neutrino masses

All possible flavour ratio is confined in a small space

e.g.) New physics just below the limit can produce any flavour ratio

KING'S College LONDON

HESE 7.5-yr Flavor new physics search

Data, 2635 days HESE sample IceCube, PRD104(2021)022002

- 17 track events, 20 log(E) bins [60 TeV, 10 PeV], 10 cosθ bins [-1.0, +1.0]
- 41 cascade events, 20 log(E) bins [60 TeV, 10 PeV], 10 cosθ bins [-1.0, +1.0]
- 2 double cascades, 20 log(E) bins [60 TeV, 10 PeV], 10 log(L) bins [10m, 100m]

Simulation

Bhattacharya et al.,JHEP06(2015)110

- Foregrounds, conventional (Honda flux), prompt (BERSS model), muon (CORSIKA)
- Astrophysical neutrinos, simple power law
- Interaction, NLO PDF DIS (CSMS model) Cooper-Sarkar et al., JHEP08(2011)042

Systematics (15 nuisance parameters)

- oscillation parameters (6)
- normalization of flux : conventional (40%), prompt (free), muon (50%), astrophysical (free)
- spectrum index : primary cosmic ray (5%) astrophysical neutrinos (free)
- Ice model : (20%)
- DOM efficiency : overall (10%), angular dependence (50%)

Limits

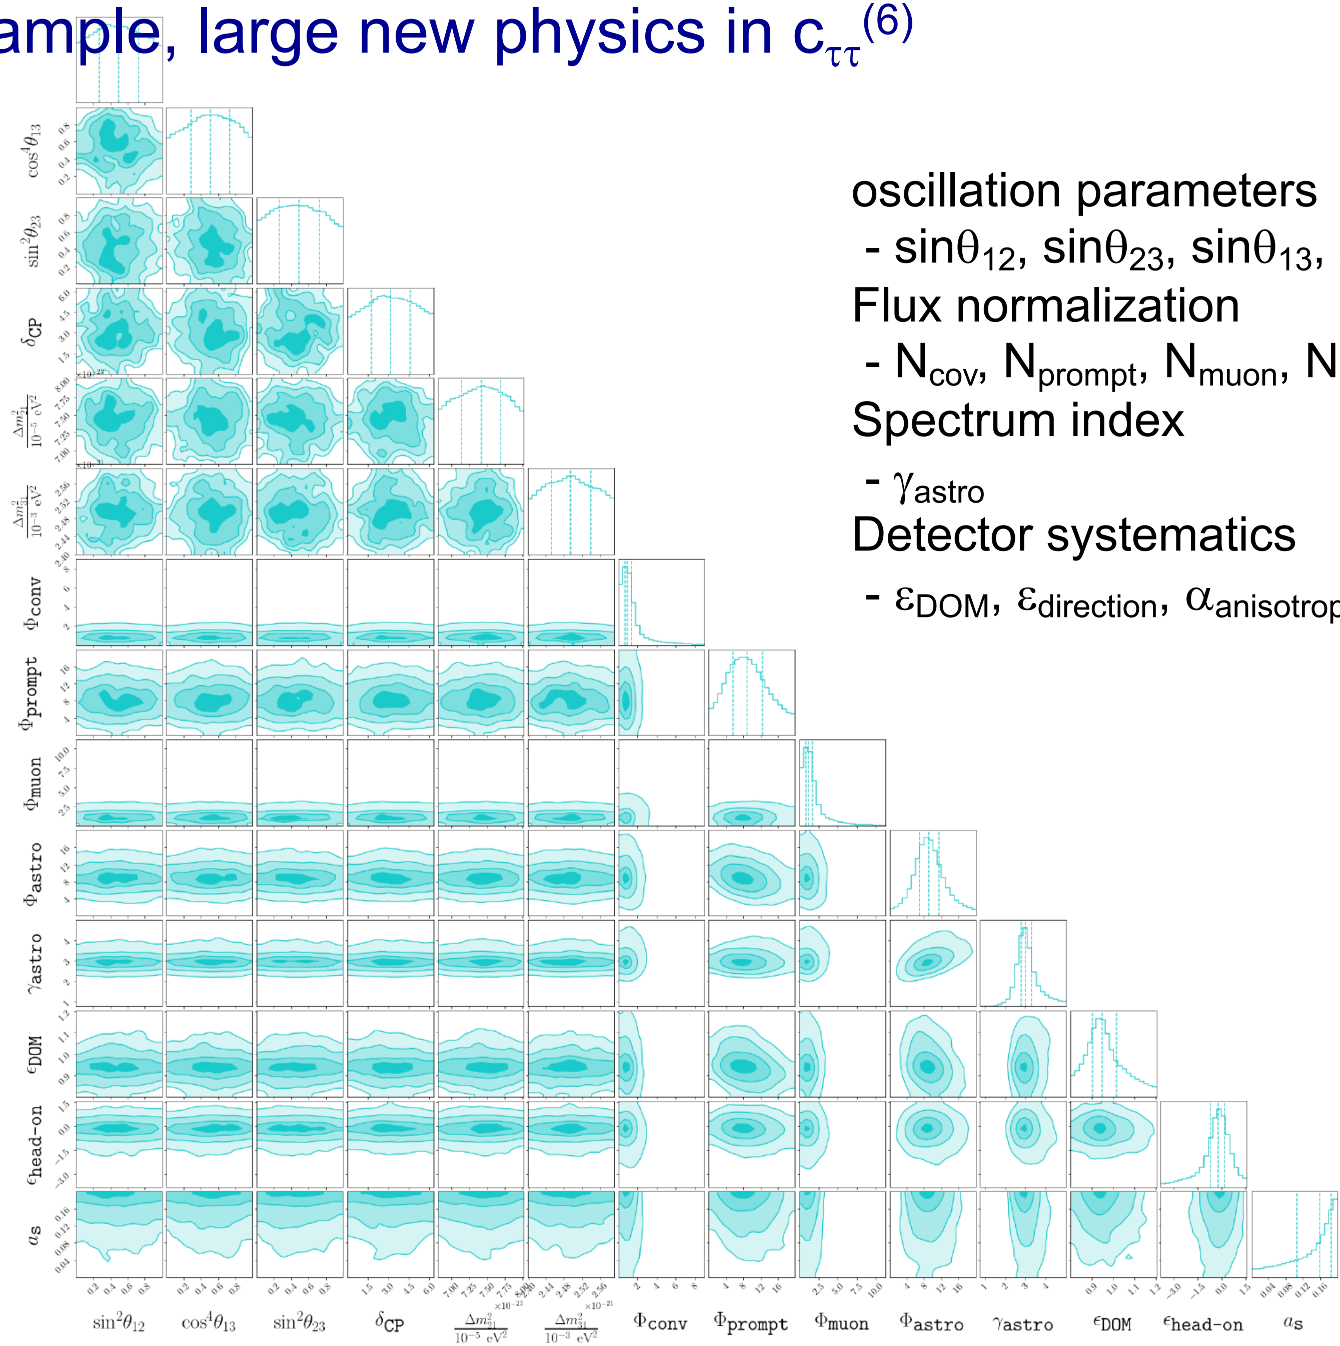
Feroz et al., Mon. Not. Roy. Astron. Soc. 398,1601(2009)1601

- Bayesian: MCMC with Multinest, Bayes factor with Jefferey' scale "strong" limit
- Frequentist: Wilks' theorem

Systematic errors

Parameter	Prior (constraint)	Range	Description
Astrophysical neutrino flux:			
$\Phi_{\mathtt{astro}}$	-	$[0, \infty)$	Normalization scale
$\gamma_{\mathtt{astro}}$	-	$(-\infty, \infty)$	Spectral index
Atmospheric neutrino flux:			
$\Phi_{\mathtt{conv}}$	1.0 ± 0.4	$[0, \infty)$	Conventional normalization scale
$\Phi_{\mathtt{prompt}}$	-	$[0, \infty)$	Prompt normalization scale
$R_{K/\pi}$	1.0 ± 0.1	$[0, \infty)$	Kaon-Pion ratio correction
$2\nu/\left(\nu + \bar{\nu}\right)_{\mathtt{atmo}}$	1.0 ± 0.1	$[0, 2]$	Neutrino-anti-neutrino ratio correction
Cosmic-ray flux:			
$\Delta\gamma_{\mathtt{CR}}$	0.0 ± 0.05	$(-\infty, \infty)$	Cosmic-ray spectral index modification
Φ_{μ}	1.0 ± 0.5	$[0, \infty)$	Muon normalization scale
Detector:			
$\epsilon_{\mathtt{DOM}}$	0.99 ± 0.1	$[0.80, 1.25]$	Absolute energy scale
$\epsilon_{\mathtt{head-on}}$	0.0 ± 0.5	$[-3.82, 2.18]$	DOM angular response
$a_{\mathtt{s}}$	1.0 ± 0.2	$[0.0, 2.0]$	Ice anisotropy scale

Fit example, large new physics in $c_{\tau\tau}^{(6)}$



oscillation parameters

- $\sin\theta_{12}$, $\sin\theta_{23}$, $\sin\theta_{13}$, Δm_{12}, Δm_{23}, δ

Flux normalization

- N_{cov}, N_{prompt}, N_{muon}, N_{astro}

Spectrum index

- γ_{astro}

Detector systematics

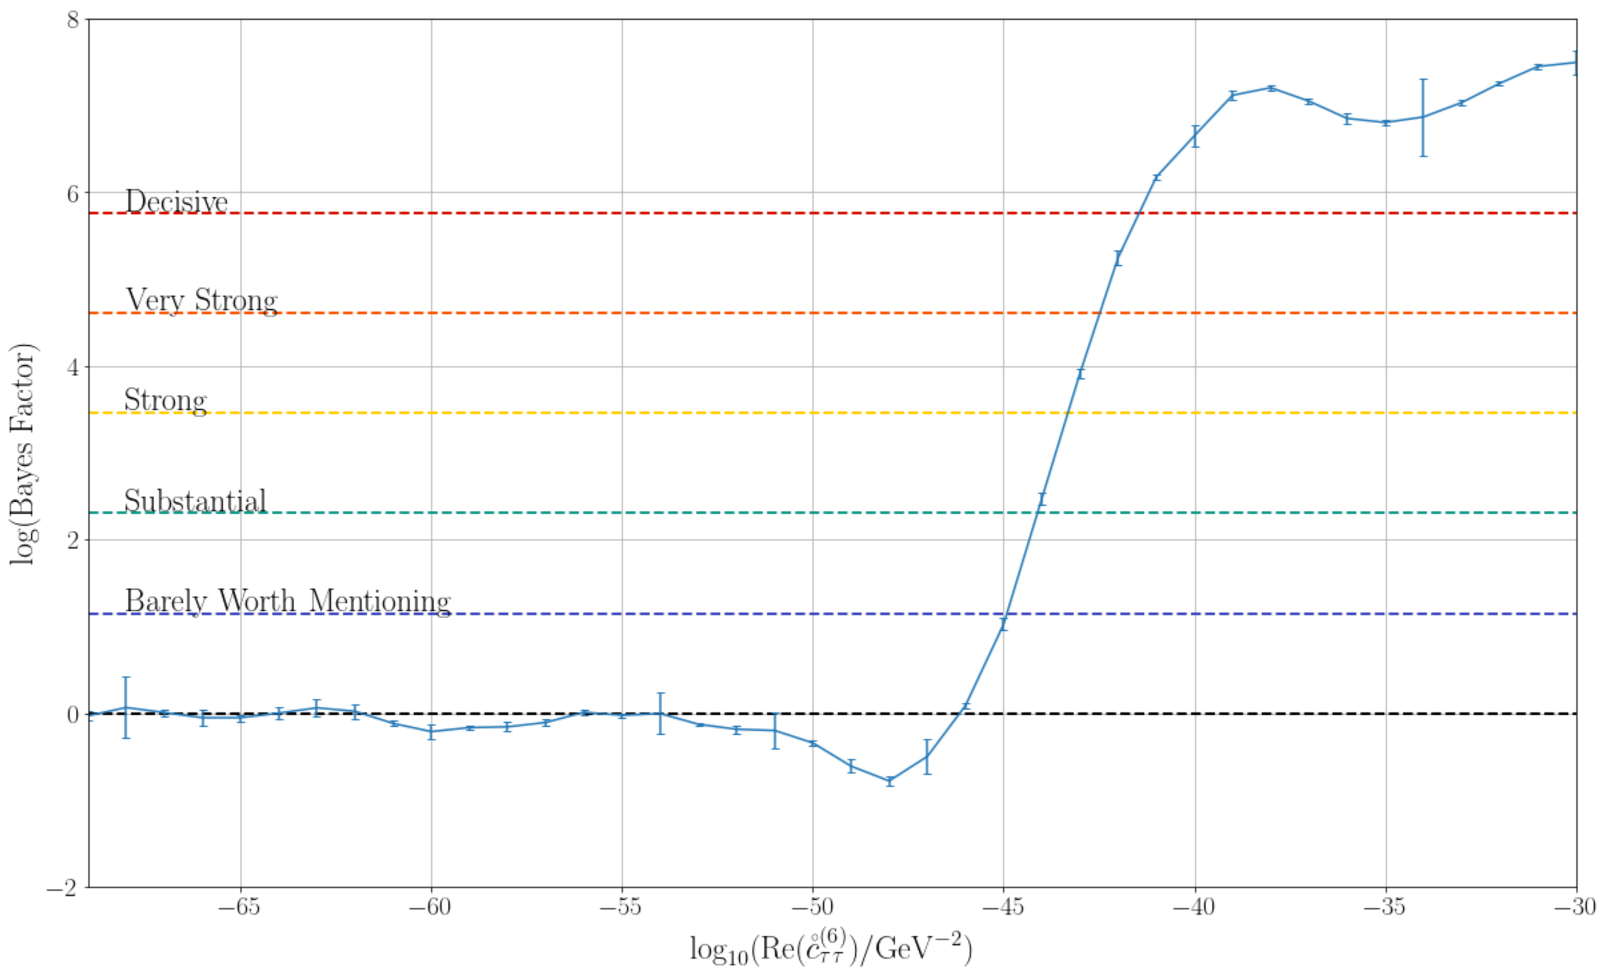
- ε_{DOM}, $\varepsilon_{direction}$, $\alpha_{anisotropy}$

IceCube, Nature Physics 18(2022)1287

Fit example, large new physics in $c_{\tau\tau}^{(6)}$

Bayesian analysis

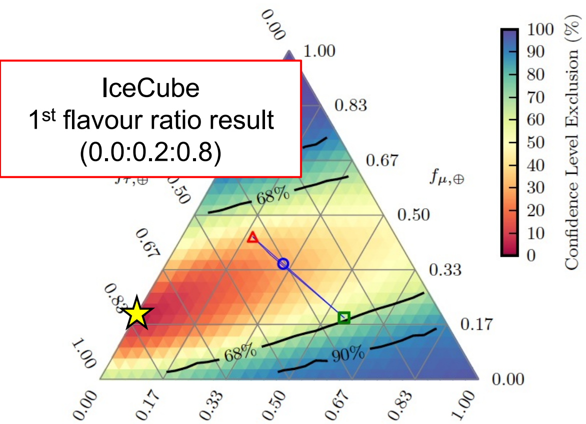
- Bayes factor is computed with new physics parameter
- Repeat this to find the threshold to set the limit

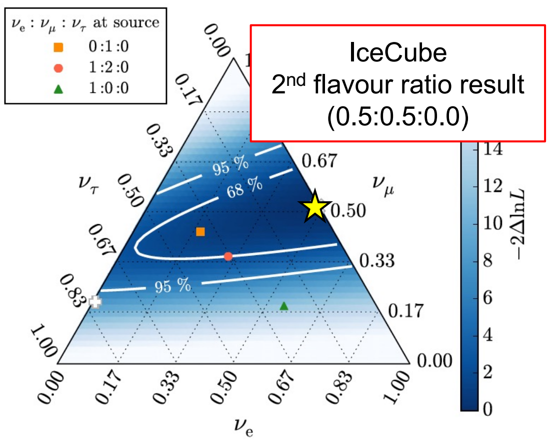


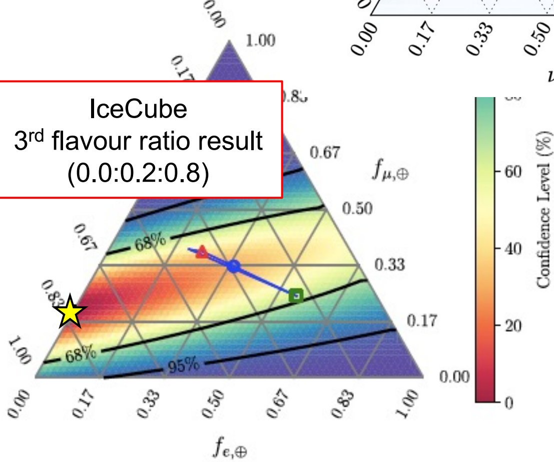
KING'S College LONDON

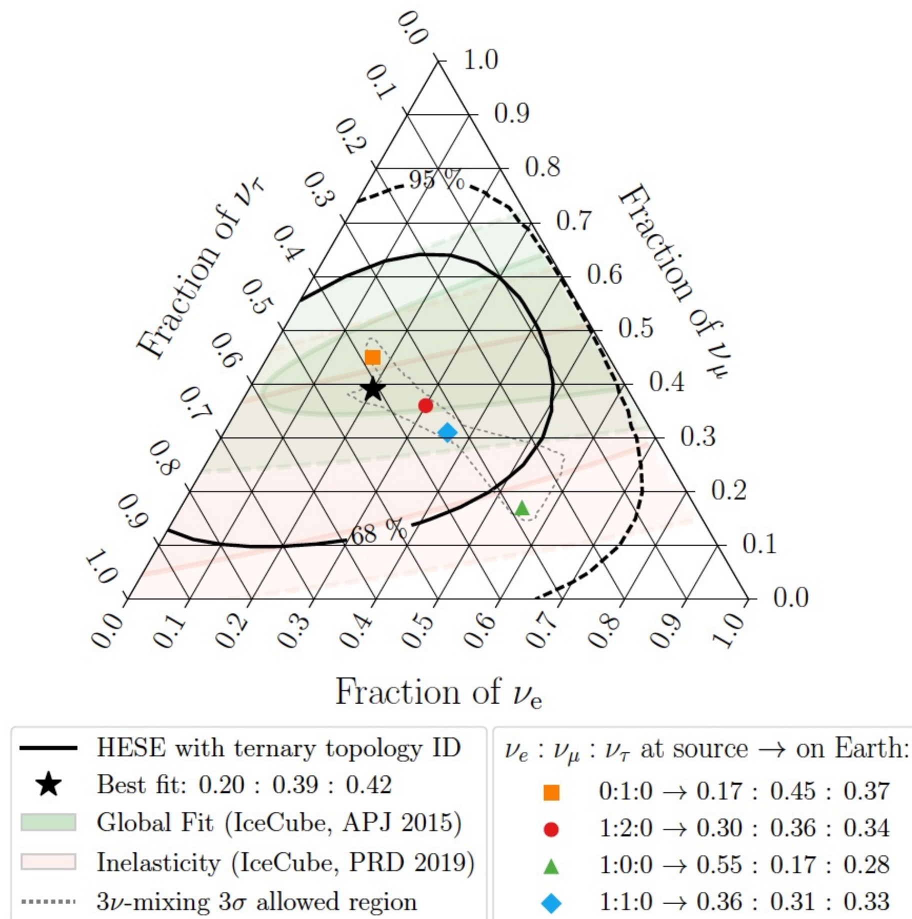
IceCube, PRL114(2015)171102, Astro.J.809:98(2015), PRD99(2019)032004, ArXiv:2011:03560

HESE 7.5-yr data (2018)







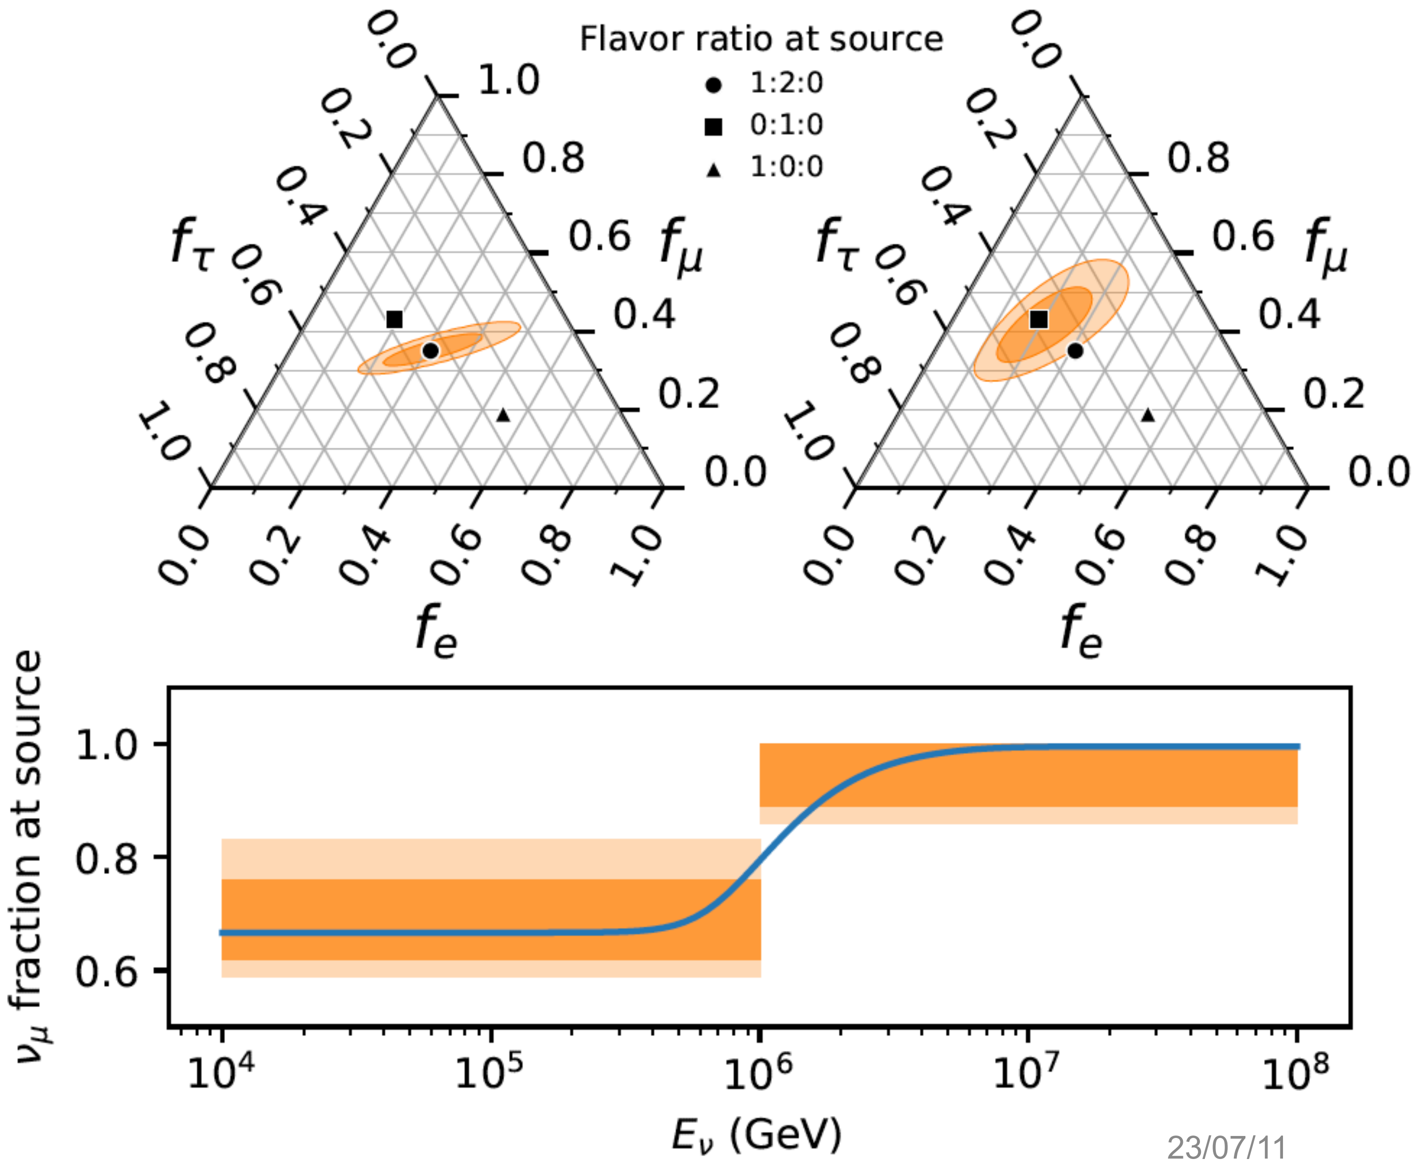


New flavour ratio measurement

- Likelihood is very shallow and fit often confuses between ν_e and ν_τ
- New flavour ratio result has some power to distinguish ν_e and ν_τ

IceCube-Gen2, J.Phys.G48(2021)060501

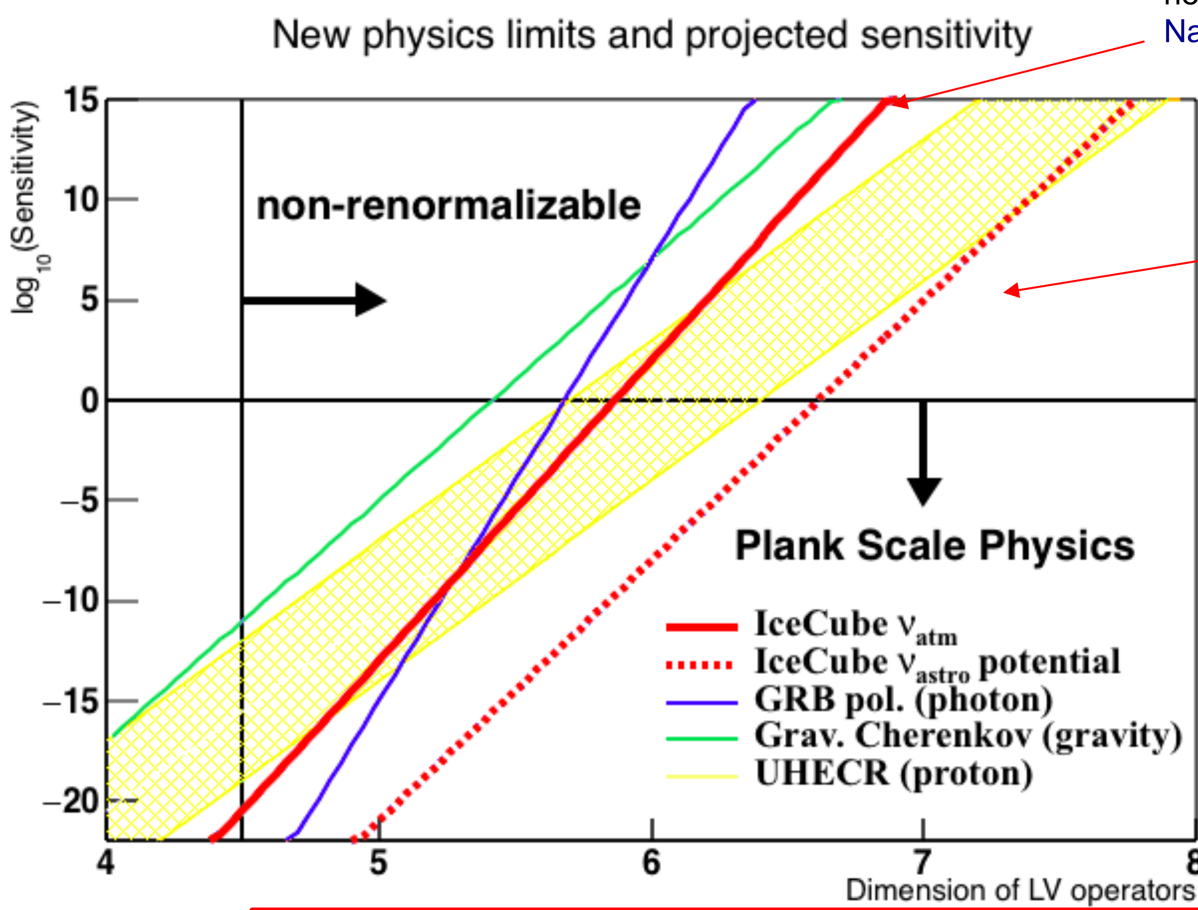
Energy dependence of flavor ratio



Neutrino interferometry – Astrophysical neutrinos

Higher-dimension operators may be related to new physics
- Dimension-5 operator (unit: GeV^{-1}), example: Majorana mass
- Dimension-6 operator (unit: GeV^{-2}), example: Fermi constant (G_F)

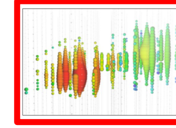
IceCube atmospheric neutrino LV sensitivity
Nature Physics 14(2018)961



IceCube astrophysical neutrino LV sensitivity

Astrophysical neutrino dim-6 LV operator search can reach quantum gravity motivated region ($\sim 1/M_{Planck}^2 \sim 10^{-38}$ GeV^{-2})

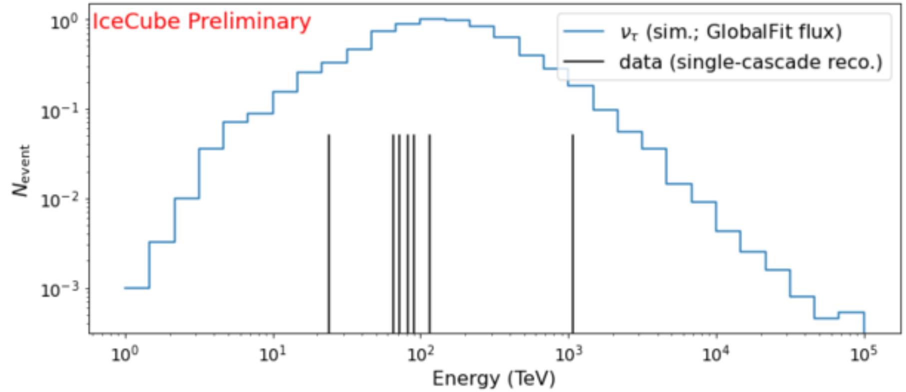
4 . New astrophysical tau neutrino sample

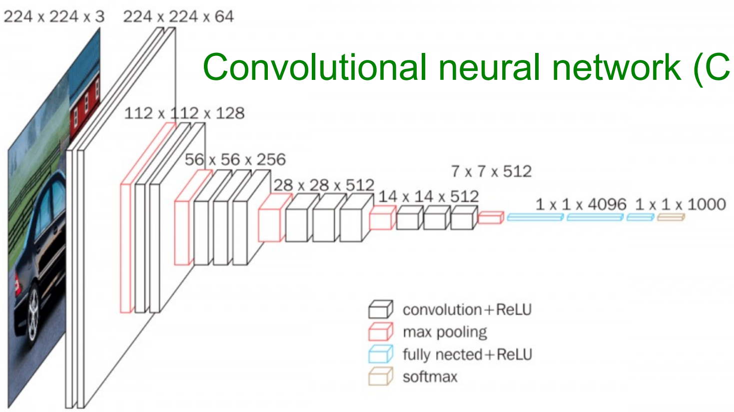


double cascade

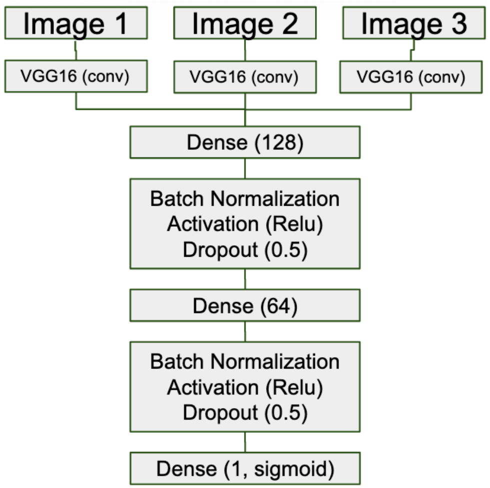
7 astrophysical tau neutrinos

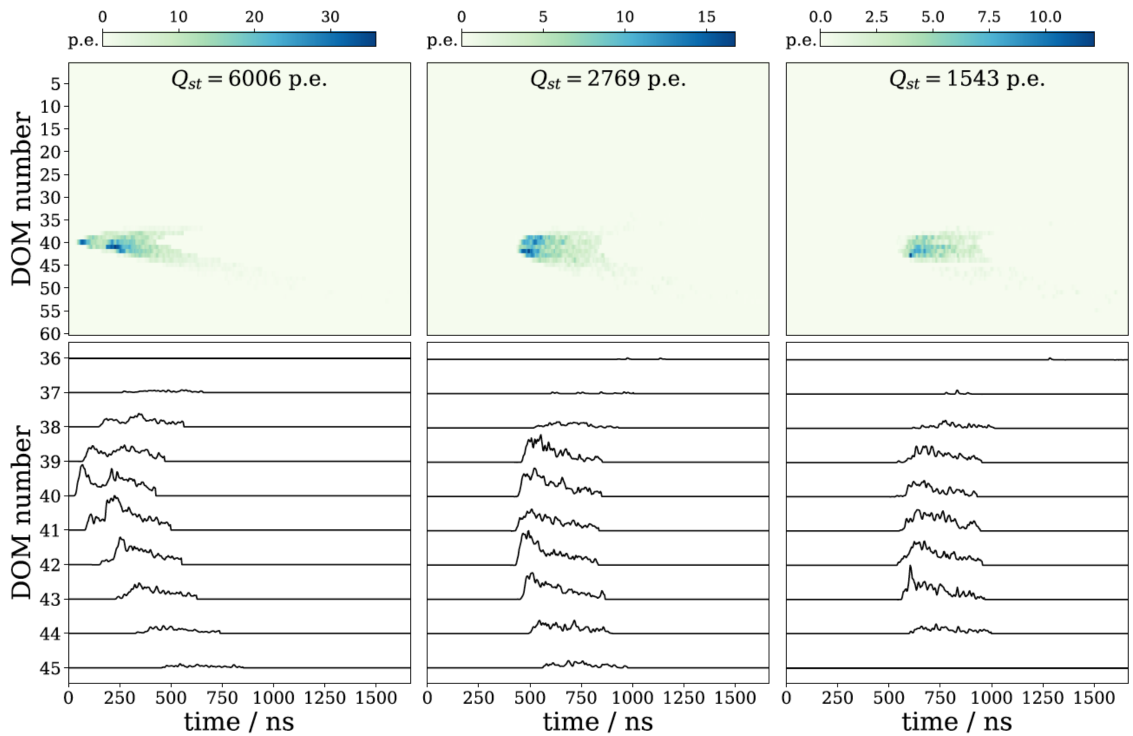
- ML-based dedicated selection
- Data consistent with prediction



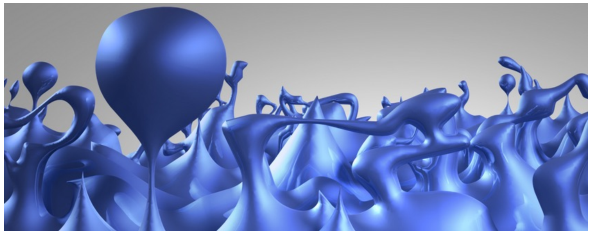


Convolutional neural network (CNN)





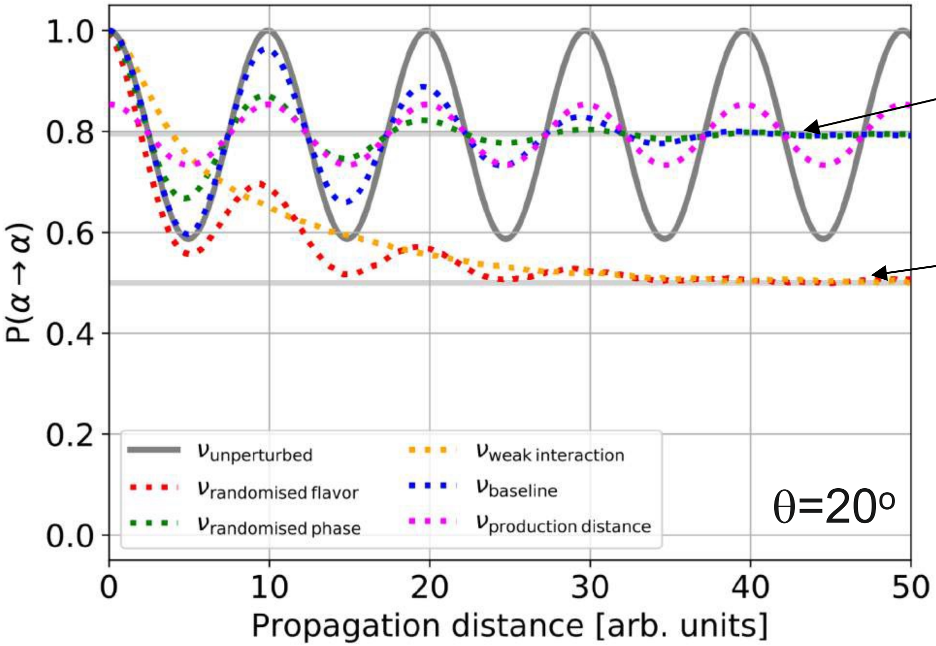
4. Neutrino decoherence



Space-time foam

Quantum gravity motivated quantum fluctuation of space-time.
- Planck scale black hole background
- D-brane fluctuation

Propagating particles lose coherence with interactions with these background
- New damping terms in oscillation



Toy model (Tom Stuttard, NBI)
- Space-time foam baseline variation damp oscillations.
- Flavor basis interaction with Space-time foam may randomize flavor basis

Different physics collapse wave functions differently.

4. Neutrino decoherence

Open quantum system

$$P_{\alpha\beta}^{OQS} = Tr\left|\rho_\alpha(t)\rho_\beta(0)\right|^2$$

- Model independent search of decoherence
- Density matrix formalism and decoherence term

$$\frac{d\rho}{dt} = -i\left[h_{eff},\rho\right] - D[\rho], \quad D[\rho] = \begin{pmatrix} 0 & \rho_{12}\gamma_{12} & \rho_{31}\gamma_{31} \\ \rho_{12}\gamma_{12} & 0 & \rho_{23}\gamma_{23} \\ \rho_{31}\gamma_{31} & \rho_{23}\gamma_{23} & 0 \end{pmatrix}$$

Damping term

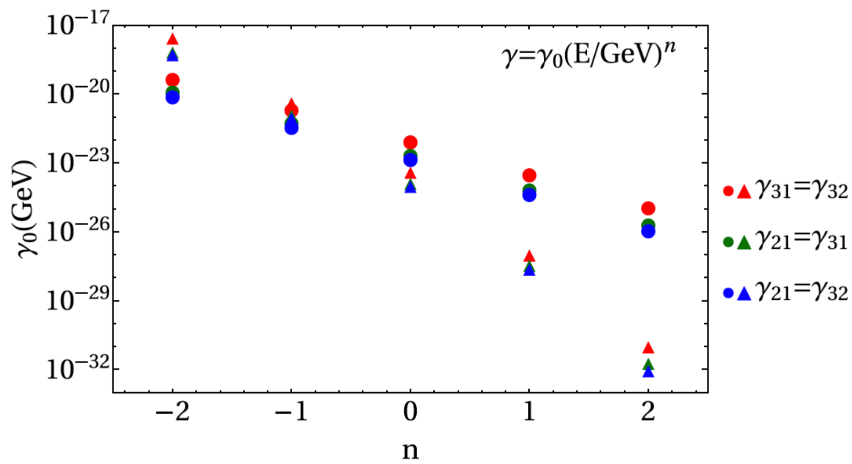
$$P_{\alpha\beta} = A \cdot \left[1 - e^{-\gamma_{ij}} cos\left(\frac{\Delta m_{ij}^2}{2E}L\right)\right], \quad \gamma_{ij} = \gamma_{ij}^0 \cdot \left(\frac{E}{GeV}\right)^n$$

- Analysis can be designed to find nonzero γ_{ij}^0.
- Experimental sensitivity is many order far away than expected Planck scale physics region?
(naturalness: decoherence length of neutrino with $E \sim M_{Planck}$ is Planck length)

Coloma et al, EPJC(2018)78:614
Stuttard and Jensen, PRD102(2020)115003,PRD104(2021)056007

4. Neutrino decoherence

Stronger sensitivity on γ_0 (damping term scale) can be obtained by assuming larger n



New analysis (Tom Stuttard, NBI)

- DeepCore data
- Weak dependence on mass ordering
- Exotic ν_μ disappearance (different pattern, new structure)
