

CONTENTS

Preface	v
Chapter I. Main Results	1
1. Statement of the spectral problem	1
2. One-term asymptotic formula for $N(\lambda)$	9
3. Hamiltonian billiards I: basic definitions and results	12
4. Hamiltonian billiards II: reflection matrix	27
5. Hamiltonian billiards III: Maslov index	32
6. Classical two-term asymptotic formula for $N(\lambda)$	38
7. Nonclassical two-term asymptotic formulae for $N(\lambda)$	51
8. Two-term asymptotic formulae for the spectral function	57
Chapter II. Oscillatory Integrals	65
1. Local oscillatory integrals and pseudodifferential operators	65
2. Global oscillatory integrals	73
3. Homogeneous canonical transformations	76
4. Phase functions associated with homogeneous canonical transformations	81
5. Restriction of phase functions to the boundary	93
6. Extension of phase functions from the boundary	95
7. Standard oscillatory integrals associated with homogeneous canonical transformations	104
8. Boundary layer oscillatory integrals associated with homogeneous canonical transformations	118
9. Boundary oscillatory integrals associated with homogeneous canonical transformations	121
10. Parameter-dependent oscillatory integrals	125
Chapter III. Construction of the Wave Group	136
1. Characteristic properties of distributions associated with the wave group	137
2. Representation of the wave group by means of oscillatory integrals: sufficient conditions	149
3. Representation of the wave group by means of oscillatory integrals: effective construction for manifolds without boundary	150
4. Representation of the wave group by means of oscillatory integrals: effective construction for manifolds with boundary	157

Typeset by $\mathcal{A}\mathcal{M}\mathcal{S}$ - \TeX

5. Construction of the wave group when the source is close to the boundary	171
Chapter IV. Singularities of the Wave Group	175
1. Singularities of Lagrangian distributions	176
2. Singularity of the wave group at $t = 0$	184
3. Singularities of the wave group at $t \neq 0$ for admissible pseudodifferential cut-offs	187
4. Singularities of the wave group at $t \neq 0$ for non-admissible pseudodifferential cut-offs	191
5. Singularity of the wave group at $t = 0$ when the source is close to the boundary	198
Chapter V. Proof of main results	201
1. Partition of the manifold M into three zones	201
2. Asymptotics of the trace of the spectral projection in the interior zone	206
3. Asymptotics of the trace of the spectral projection in the intermediate zone	210
4. Asymptotics of the trace of the spectral projection in the boundary zone	214
5. Asymptotics of the spectral function	235
Chapter VI. Mechanical applications	240
1. Membranes and acoustic resonators	240
2. Elastic plates	241
3. Two- and three-dimensional elasticity	246
4. Elastic shells	248
5. Hydroelasticity	256
Appendix A. Spectral problem on the half-line	260
BY A. HOLST	
1. Basic facts	260
2. The reflection matrix	272
3. Trace formulae	287
4. Dependence on parameters	305
Appendix B. Fourier Tauberian theorems	309
BY M. LEVITIN	
1. Introductory remarks	309
2. Basic theorem	310
3. Rough estimate for the nonzero singularities	313
4. General refined theorem	313
5. Special version of the general refined theorem	316
Appendix C. Stationary phase formula	318
Appendix D. Hamiltonian billiards: proofs	324
1. Measure of “awkward” starting points	324
2. Dead-end trajectories	329
3. Convexity and concavity	332
4. Measurability of sets and functions	335
5. Lengths of loops and periodic trajectories	337
6. Maslov index	339

Appendix E. Factorization of smooth functions and Taylor-type formulae	346
References	353
Principal notation	358
